

Operational Description

The transmitter of the EUT (FM transmitter) is powered by 3V Battery. The antenna is Soldering wire. The output power of this device is very low. Under normal use condition, the transmitter and the receiver are quite close, so high EIRP power is neither necessary nor allowed because of interference.

The FM Transmitter is a hand-held gadget, which can transform audio signal, such as audio output of portable devices, into FM signals of three bands. It is very suitable for users to listen to the un-upgradeable FM receiver-bundled stereo, which cannot be connected to the music source through audio signal cable or even has no audio input.
