Measurement/Technical Report for AeroScout Ltd.

T3s Staff Tag

TAG-3200-CU

FCC ID: Q3HTAG3200

IC: 5115A-TAG3200

9 March 2014

This report concerns: Original Grant: X

Class I Change: Class II Change:

Equipment type: Spread Spectrum/Digital Device

2400-2483.5 MHz

Limits used: 47CFR15 Section 15.247

Measurement procedure used is KDB 558074 D01 9, April 2013 and ANSI C63.4-2003.

Application for Certification Applicant for this device:

1. General Information

1.1 Administrative Information

Manufacturer: AeroScout Ltd.

Manufacturer's Address: 3 Pekeris St.

Einstein Entrance

4th Floor

Rechovot 76702

Tel: +972-8-9369393 Fax: +972-8-9365977

Manufacturer's Representative: Dadi Matza

Equipment Under Test (E.U.T): T3s Staff Tag

Equipment Model No.: TAG-3200-CU

Equipment Serial No.: Not designated

Date of Receipt of E.U.T: 18.02.2014

Start of Test: 18.02.2014

End of Test: 20.02.2014

Test Laboratory Location: I.T.L (Product Testing) Ltd.

Kfar Bin Nun, ISRAEL 99780

Test Specifications: FCC Part 15, Subpart C

RSS-210, Issue 8, 2010

1.2 List of Accreditations

The EMC laboratory of I.T.L. is accredited by the following bodies:

- 1. The American Association for Laboratory Accreditation (A2LA) (U.S.A.), Certificate No. 1152.01.
- 2. The Federal Communications Commission (FCC) (U.S.A.), Registration No. 90715.
- 3. The Israel Ministry of the Environment (Israel), Registration No. 1104/01.
- 4. The Voluntary Control Council for Interference by Information Technology Equipment (VCCI) (Japan), Registration Numbers: C-1350, R-1285.
- 5. Industry Canada (Canada), IC File No.: 46405-4025; Site No. IC 4025B-1.

I.T.L. Product Testing Ltd. is accredited by the American Association for Laboratory Accreditation (A2LA) and the results shown in this test report have been determined in accordance with I.T.L.'s terms of accreditation unless stated otherwise in the report.

1.3 Product Description

T3s Tags use any standard Wi-Fi network infrastructure, keeping costs low and making deployments simple and fast. The tags can be used to determine the location and status of hospital staff. The Tags' wireless messages are received by Wi-Fi access points.

The T3s Tag has a single, replaceable battery. The tag is able to report its battery level to MobileView. The T3s Tag also has a motion sensor to conserve battery life when the tag is not in motion.

The T3s Tag includes embedded Low-Frequency (LF) receiver and an optional Ultrasound receiver. Ultrasound signals do not go through walls and thus ensure accurate room-level resolution when and where required (e.g. determining if a nurse is attending to a patient in a room). T3s Tags also provide instant notification when a tagged staff member passes through a gate, doorway or other tightly-defined area.

A call button provides the capability to define alerts according to button clicks – such as a staff duress situation requiring immediate assistance or attention. Multiple messages can be set up using different button-click patterns.

T3s Tags contain on-board motion sensors. The motion sensor can be configured to trigger alerts (e.g. when a staff member is not in motion for a long period of time). It also enables different transmission intervals for tags when they are stationary or in motion, which reduces unnecessary network traffic and conserves battery life.

The T3s Tag enclosure is designed for durability against significant impacts and is water and dust resistant.

T3s Tags are easily configured and activated wirelessly via the Tag Manager application and a Tag Activator device.

The T3s Tag comes with a retractable reel to integrate with staff members' identification badges and a lanyard flange. Other attachment options include badge clip and retractable reel with back clip.

1.4 Test Methodology

Radiated testing was performed according to the procedures in KDB 558074 D01 9, April 2013 and ANSI C63.4: 2003. Radiated testing was performed at an antenna to EUT distance of 3 meters.

1.5 Test Facility

The radiated emissions tests were performed at I.T.L.'s testing facility at Kfar Bin-Nun, Israel. This site is a FCC listed test laboratory (FCC Registration No. 90715, date of listing September 3, 2009).

I.T.L.'s EMC Laboratory is also accredited by A2LA, certificate No. 1152.01.

1.6 Measurement Uncertainty

Radiated Emission

Radiated Emission (CISPR 11, EN 55011, CISPR 22, EN 55022, ANSI C63.4) for open site 30-1000MHz:

Expanded Uncertainty (95% Confidence, K=2):

 \pm 5.2 dB

Note: See ITL Procedure No. PM 198.

2. System Test Configuration

2.1 Justification

Radiated emission screening was performed in 3 orthogonal orientations. The worst case orientation was the vertical position.

2.2 EUT Exercise Software

No special exercise software was used.

2.3 Special Accessories

No special accessories were needed to achieve compliance.

2.4 Equipment Modifications

No modifications were necessary in order to achieve compliance.

2.5 Configuration of Tested System

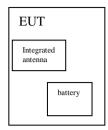

Figure 1. Configuration of Tested System

3. Radiated Measurement Test Set-up Photo

Figure 2. Radiated Emission Test

Figure 3. Radiated Emission Test

Figure 4. Radiated Emission Test

Figure 5. Radiated Emission Test

4. 6 dB Minimum Bandwidth

4.1 Test procedure

The E.U.T operation mode and test set-up are as described in Section 3.

See Section 3.1 Justification of the System Test Configuration concerning the E.U.T. orientation for this test.

The E.U.T was tested at the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in *Figure 1*.

The spectrum bandwidth of the E.U.T. at the point of 6 dB below maximum peak power was measured and recorded.

6. Maximum Transmitted Peak Power Output

6.1 Test procedure

The E.U.T operation mode and test set-up are as described in Section 3.

See Section 3.1 Justification of the System Test Configuration concerning the E.U.T. orientation for this test.

The E.U.T was tested at the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in Figure 1.

The E.U.T. was tested at low, mid and high channels at 20MHz with the following modulations: BPSK (6Mbps).

Radiated output power levels were measured at selected operation frequencies and the results were converted to power level according to the formula as shown below:

$$P = \frac{(E_{V/m} \times d)^2}{(30 \times G)}$$
 [W]

E - Field Strength (V/m)

d – Distance from transmitter (m)

G – Antenna gain

P – Peak power (W)

7. Band Edge Spectrum

[In Accordance with section 15.247(c)]

7.1 Test procedure

The E.U.T operation mode and test set-up are as described in Section 3.

See Section 3.1 Justification of the System Test Configuration concerning the E.U.T. orientation for this test.

The E.U.T was tested at the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in Figure 1.

The E.U.T. was tested at low, mid and high channels at 20MHz with the following modulations: BPSK (6Mbps).

8. Radiated Emission, 9 kHz - 30 MHz

8.1 Test Specification

9 kHz-30 MHz, FCC, Part 15, Subpart C, Section 209

8.2 Test Procedure

The E.U.T. operation mode and test set-up are as described in Section 3.

A preliminary measurement to characterize the E.U.T was performed inside the shielded room at a distance of 3 meters, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in Figure 3.1.

The frequency range 9 kHz-30 MHz was scanned.

The emissions were measured using a computerized EMI receiver complying with CISPR 16 requirements. The specification limits and applicable correction factors are loaded to the receiver via a 3.5" floppy disk.

In the frequency range 9 kHz-30MHz, the loop antenna was rotated on its vertical axis. The antenna height (center of loop) was 1 meter at a distance of 3 meters.

The E.U.T. was operated at the low, mid and high channels using a peak detector.

8.3 Measured Data

JUDGEMENT: Passed by more than 20dB.

The EUT met the requirements of the F.C.C. Part 15, Subpart C, Section 209 specification.

Figure 25 Test Equipment Used

8.5 Field Strength Calculation

The field strength is calculated directly by the EMI Receiver software, and a "Correction Factors" data disk, using the following equation:

$$FS = RA + AF + CF$$

FS: Field Strength [dBµv/m]

RA: Receiver Amplitude [dBµv]

AF: Receiving Antenna Correction Factor [dB/m]

CF: Cable Attenuation Factor [dB]

Example: $FS = 30.7 \text{ dB}\mu\text{V}$ (RA) + 14.0 dB (AF) + 0.9 dB (CF) = 45.6 dB μV

No external pre-amplifiers are used.

9. Spurious Radiated Emission, 30 – 25000 MHz

9.1 Radiated Emission 30-25000 MHz

The E.U.T operation mode and test set-up are as described in Section 3.

See Section 3.1 Justification of the System Test Configuration concerning the E.U.T. orientation for this test.

A preliminary measurement to characterize the E.U.T was performed inside the shielded room, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in *Figure 1*.

The levels of the emissions within the frequency ranges of the restricted bands (Section 15.205 of FCC Part 15) were compared to the limits of the table in Section 15.209 (a), General Requirements.

<u>In the frequency range 1-2.9 GHz</u>, a computerized EMI receiver complying with CISPR 16 requirements was used.

<u>In the frequency range 2.9-25.0 GHz</u>, a spectrum analyzer including a low noise amplifier was used. During average measurements, the IF bandwidth was 1 MHz and the video bandwidth was 100Hz. During peak measurements, the IF bandwidth was 1 MHz and the video bandwidth was 3 MHz.

The test distance was 3 meters.

The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization.

Verification of the E.U.T emissions was based on the following methods: turning the E.U.T on and off; using a frequency span less than 10 MHz; observation of the signal level during turntable rotation. (Background noise is not affected by the rotation of the E.U.T.)

The E.U.T. was operated at the low, mid and high channels using a peak detector.

9.2 Test Data

JUDGEMENT: Passed by 3.3 dB

For the operation frequency of 2412 MHz, the margin between the emission level and the specification limit is in the worst case 3.7 dB at the frequency of 9648 MHz, vertical polarization.

For the operation frequency of 2437 MHz, the margin between the emission level and the specification limit is in the worst case 5.1 dB at the frequency of 9747 MHz, horizontal polarization.

For the operation frequency of 2462 MHz, the margin between the emission level and the specification limit is 3.3 dB in the worst case at the frequency of 9848 MHz, horizontal polarization.

The results for all modulations were the same.

The EUT met the requirements of the F.C.C. Part 15, Subpart C, specification.

The details of the highest emissions are given in *Figure 26* to *Figure 31*.

10. Transmitted Power Density

[In accordance with section 15.247(d)]

10.1 Test procedure

The E.U.T operation mode and test set-up are as described in Section 3.

See Section 3.1 Justification of the System Test Configuration concerning the E.U.T. orientation for this test.

The E.U.T was tested at the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The configuration tested is shown in *Figure 1*.

The spectrum analyzer was set to 3 kHz resolution BW and sweep time of 1 second for each 3 kHz "window". The spectrum peaks were located at each of the 3 operating frequencies.

$$P = \frac{(E_{V/m} \times d)^2}{(30 \times G)}$$

11. Antenna Gain/Information

The antenna gain is -3 dBi.

12. Average Factor Calculation

- 1. Burst duration = 450usec
- 2. Time between bursts = 530msec
- 3. Pulse duration = N/A
- 4. pulse period = N/A
- 5. Average Factor = $20 \log \left[\frac{\text{Pulse duration}}{\text{Pulse period}} \times \frac{\text{burst duration}}{100 \text{msec}} \times \text{Num of burst within } 100 \text{msec} \right]$

Average Factor =
$$20\log\left[\frac{0.45}{100}\right] = -46.9dB$$

13. R.F Exposure/Safety

Typical use of the E.U.T. is a staff tag. The E.U.T. is typically worn on a strap/necklace. The typical distance between the E.U.T. and the user in the worst case application, is 1 cm.

Calculation of Maximum Permissible Exposure (MPE)
Based on Section 1.110 Requirements

(a) FCC limits at 2437 MHz is:
$$1\frac{mW}{cm^2}$$

Using table 1 of Section 1.1310 limit for general population/uncontrolled exposures, the above level is an average over 30 minutes.

(b) The power density produced by the E.U.T. is

$$S = \frac{P_t G_t}{4\pi R^2}$$

 P_{t} - Transmitted Power 110.38 dBuV/m (peak) = 33 mW

G_T- Antenna Gain, -3 dBi

R- Distance from Transmitter using 1 cm worst case

- (c) The duty cycle of transmission in actual worst case is 500μ sec every 1 second (500μ sec\100msec<1%).
- (d)

The average power source is:

$$P_{AV} = 33 \times 0.01 = 0.33 mW$$

(e) The peak power density (time averaging) of the E.U.T. is:

$$S_{AV} = \frac{0.33 \times 0.5}{4\pi} = 0.02 \frac{mW}{cm^2}$$

(e) This is below the FCC limit.

14. APPENDIX A - CORRECTION FACTORS
