Subject: Final power amplifier DC Current consumption.

I would like to bring to your attention that the AirMux/WinLink/FibAir/MRL system that was tested at Hermon Labs 02/2005 for FCC standards have final power amplifier with normal constant DC voltage/current consumption of:

ICC= 100mA

Vcc=3.3v

This is the maximum consumption in order to obtain transmit power of 12.8dBm according to the final test results, and blocked by HW and SW and is not user configurable.

Sincerely  
Dan Weitzman
