Summary

Tests for compliance with FCC Regulations Part 15, Subpart C, and Industry Canada RSS-210, were performed on Raven Industries, Inc. model Tempur-Pedic Hand Control. This device is subject to the Rules and Regulations as a Transmitter.

In testing completed on 16-May-03, the device tested in the worst case met the allowed FCC specifications for radiated emissions by 8.0 dB (see p. 6). Besides harmonics, there were no other significant spurious emissions found; emissions from digital circuitry were negligible. Conducted emission tests do not apply, since the device is powered from a 6 VDC battery.

1. Introduction

Raven Industries, Inc. model Tempur-Pedic Hand Control was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989, and with Industry Canada RSS-210, Issue 5, November, 2001. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057).

2. Test Procedure and Equipment Used

The pertinent test equipment commonly used in our facility for measurements is listed in Table 2.1 below. The middle column identifies the specific equipment used in these tests.

Table 2.1 Test Equipment.

Test Instrument	Eqpt. Used	Manufacturer/Model
Spectrum Analyzer (0.1-1500 MHz)		Hewlett-Packard, 182T/8558B
Spectrum Analyzer (9kHz-22GHz)	X	Hewlett-Packard 8593A SN: 3107A01358
Spectrum Analyzer (9kHz-26GHz)	X	Hewlett-Packard 8593E, SN: 3412A01131
Spectrum Analyzer (9kHz-26GHz)		Hewlett-Packard 8563E, SN: 3310A01174

Signal Generator		Hewlett-Packard 8657B

3. Configuration and Identification of Device Under Test

The DUT is a 310 MHz transmitter, approximately 2.5 x 1 x 3.5 inches in size, which is designed to send identification and control signals for adjustable bed control. The carrier signal is a pulse-position modulated code generated by a SAW stabilized oscillator. Coding is performed by a microchip, timed by a 12.8 MHz crystal oscillator.

The DUT was designed and manufactured by Raven Industries, Inc., 4372 Green Ash Drive, Earth City, MO 63045. It is identified as:

Raven Industries, Inc. Transmitter
Model: Tempur-Pedic Hand Control
S/N or P/N: 53992
FCC ID: Q6L508368
IC: 2004A-508368

The transmitter transmits for up to 50 seconds as long as the button is depressed.

3.1 Modifications Made

There were no modifications made to the DUT by this laboratory.

4. Emission Limits

The DUT tested falls under the category of an Intentional Radiators and the Digital Devices. For FCC, it is subject to Part 15, Subpart C, (Section 15.231), Subpart B, (Section 15.109), and Subpart A, (Section 15.33). For Industry Canada it is subject to RSS-210, (Sections 6.1 and 6.3). The applicable testing frequencies with corresponding emission limits are given in Tables 4.1 and 4.2 below. As a digital device, the DUT is considered a Class B device.

4.1 Radiated Emission Limits

Table 4.1. Radiated Emission Limits (FCC: 15.33, 15.35, 15.109; IC: RSS-210, 6.2.2(r)).
(Digital Class B)

Freq. (MHz)	E_{lim} (3m) µV/m	E_{lim} dB(µV/m)
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
960-2000	500	54.0

Note: Average readings apply above 1000 MHz (1 MHz BW)
Quasi-Peak readings apply to 1000 MHz (120 kHz BW)

Table 4.2. Radiated Emission Limits (FCC: 15.231(b), 15.205(a); IC: RSS-210; 6.1, 6.3).
(Transmitter)

Frequency	Fundamental Ave. E_{lim} (3m)		Spurious** Ave. E_{lim} (3m)	
(MHz)	(μV/m)	dB (μV/m)	(μV/m)	dB (μV/m)
260.0-470.0	3750-12500*		375-1250	
322-335.4 399.9-410 608-614	Restricted Bands		200	46.0
960-1240 1300-1427 1435-1626.5 1660-1710 1718.9-1722.2 2200-2300	Restricted Bands		500	54.0

* Linear interpolation, formula: E = -7083 + 41.67*f (MHz)
** Measure up to tenth harmonic; 120 kHz BW up to 1 GHz, 1 MHz BW above 1 GHz

4.3 Conducted Emissions Limits

The conductive emission limits and tests do not apply here, since the DUT is powered by a 6 VDC battery.

5. Radiated Emission Tests and Results

5.1 Anechoic Chamber Measurements

To familiarize with the radiated emission behavior of the DUT, the DUT was first studied and measured in a shielded anechoic chamber. In the chamber there is a set-up similar to that of an outdoor 3-meter site, with a turntable, an antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed.

In testing for radiated emissions, the transmitter was activated using the lock/unlock button with a special wooden clamp for repeated pulse emissions. It was placed on the test table flat, on its side, or on its end.

In the chamber we studied and recorded all the emissions using a Bicone antenna up to 300 MHz and a ridged horn antenna above 200 MHz. The measurements made in the chamber below 1 GHz are used for pre-test evaluation only. The measurements made above 1 GHz are used in pre-test evaluation and in the final compliance assessment. We note that for the horn antenna, the antenna pattern is more directive and hence the measurement is essentially that of free space (no ground reflection). Consequently it is not essential to measure the DUT for both antenna polarizations, as long as the DUT is measured on all three of its major axis. In the chamber we also recorded the spectrum and modulation characteristics of the carrier. These data are presented in subsequent sections. We also note that in scanning from 30 MHz to 3.15 GHz using Bicone and the ridge horn antennas, there were no other significant spurious emissions observed.

5.2 Open Site Radiated Emission Tests
After the chamber measurements, the emissions were re-measured on the outdoor 3-meter site at fundamental and harmonics up to 1 GHz using tuned dipoles and/or the high frequency Bicone. Photographs included in this filing show the DUT on the Open Area Test Site (OATS).

5.3 Computations and Results for Radiated Emissions
To convert the dBm's measured on the spectrum analyzer to dB(μV/m), we use expression

$$E_3(dB\mu V/m) = 107 + P_R + K_A - K_G$$

where P_R = power recorded on spectrum analyzer, dB, measured at 3m
K_A = antenna factor, dB/m
K_G = pre-amplifier gain, including cable loss, dB

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Table 5.1. There we see that the DUT meets the limit by 8.0 dB.

5.4 Conducted Emission Tests
These tests do not apply, since the DUT is powered from a 6 VDC battery.

6. Other Measurements

6.1 Correction For Pulse Operation FCC 15.35; IC 6.5
When the transmitter is activated by push action, it transmits a pulse modulated 310 carrier for up to 50 seconds so long as a button is depressed. The worst case on time in a 100 ms window occurs when the device transmits one 1.062 ms pulse, followed by thirteen 0.575 ms pulses. See Figure 6.1. Thus, the duty factor is

$$K_E = (1 \times 1.062 \text{ ms} + 13 \times 575\ \mu s) / 100 \text{ ms} = 0.085 \text{ or } -21.4 \text{ dB}.$$

Since this calculated duty factor is greater than 20 dB below the peak, only a correction of 20 dB is applied per FCC 15.35.

6.2 Emission Spectrum FCC 15.215(b)
Using the ridge-horn antenna and DUT placed in its aperture, emission spectrum was recorded and is shown in Figure 6.2.

6.3 Bandwidth of the Emission Spectrum FCC 15.231(b)(3); IC 6.1.1(c)
The measured spectrum of the signal is shown in Figure 6.3. The allowed (-20 dB) bandwidth is 0.25% of 310MHz, or 775.0 kHz. From the plot we see that the -20 dB bandwidth is 69.0 kHz, and the center frequency is 310 MHz.

6.4 Periodic Operation FCC 15.231(a)(1,2); IC 6.1.1(a)(1,2)
The DUT is manually activated and ceases to transmit within 5 seconds of deactivation. See Figure 6.4.

6.4 Effect of Supply Voltage Variation
The DUT has been designed to be powered four 1.5 VDC batteries. For this test, the battery was replaced by a laboratory variable power supply. Relative power radiated was measured at the fundamental as the voltage was varied from 4 to 8 volts. The emission variation is shown in Figure 6.5.

6.5 Input Voltage at Battery Terminals

Batteries:	before testing	V_{oc} =	6.36 V
	after testing	V_{oc} =	6.20 V
Ave. current from batteries		I =	85 mA (CW)
