Revisions

Revision No.	Date MM/DD/YYYY	Reason for Change	Author
0	06/16/2015	Original Document	N/A
1	07/16/2015	Added additional plots and test data for ANT - 48	SK

Note: Latest revision report will replace all previous reports.

Statement of Compliance

Manufacturer:	Aruba Networks 1344 Crossman Ave. Sunnyvale, CA 94089 (408) 990- 2557
Requester / Applicant:	Robert Hastings
Name of Equipment:	Wireless Access Point
Model No.	APIN0324 and APIN0325
Type of Equipment:	Intentional Radiator
Application of Regulations:	CFR 47 Part 15.407 2014
Test Dates:	22 Mar 2015 to 15 June 2015

Guidance Documents:

Emissions: ANSI C63.10-2009 789033 D02 General UNII Test Procedures New Rules v01

Test Methods:

Emissions: ANSI C63.10-2009 789033 D02 General UNII Test Procedures New Rules v01

The electromagnetic compatibility test and documented data described in this report has been performed and recorded by TUV Rheinland, in accordance with the standards and procedures listed herein. As the responsible authorized agent of the EMC laboratory, I hereby declare that the equipment described above has been shown to be compliant with the EMC requirements of the stated regulations and standards based on these results. If any special accessories and/or modifications were required for compliance, they are listed in the Executive Summary of this report.

This report must not be used to claim product endorsement by A2LA or any agency of the U.S. Government. This report contains data that are not covered by A2LA accreditation. This report shall not be reproduced except in full, without the written authorization of TUV Rheinland of North America.

Suresh Kondapalli

Test Engineer Date June 16, 2015

Testing Cert #3331.02 **US5254** **2932M-1**

1 Executive Summary

1.1 Scope

This report is intended to document the status of conformance with the requirements of the CFR 47 Part 15.407 2014 based on the results of testing performed on 22 Mar 2015 to 15 June 2015 on the Wireless Access Point Model APIN0324 and APIN0325 manufactured by Aruba Networks This report only applies to the specific samples tested under the stated test conditions. It is the responsibility of the manufacturer to assure that additional production units of this model are manufactured with identical or EMI equivalent electrical and mechanical components. This report is further intended to document changes and modifications to the EUT throughout its life cycle. All documentation will be included as a supplement.

1.2 Purpose

Testing was performed to evaluate the EMC performance of the EUT in accordance with the applicable requirements, procedures, and criteria defined in the application of regulations and application of standards listed in this report. The 5725 MHz to 5850 MHz frequency band is covered in this document.

1.3 Summary of Test Results

Table 1: Summary of Test Results

Test	Test Method ANSI C63.4	Test Parameters (Measured)	Result
Spurious Emission in Transmitted Mode	CFR47 15.209, CFR47 15.407 (b)	Limit: Class B	**Complied**
Restricted Bands of Operation	CFR47 15.205,	Class B, see plots	**Complied**
AC Power Conducted Emission	CFR47 15.207	Class B, see plots	**Complied**
Occupied Bandwidth (MHz)	CFR47 15.407 (a)	11a: 16.38 (6dB) 16.54(99%) HT20: 17.44(6dB) 17.66(99%) HT40: 35.66(6dB) 36.07(99%) VHT80: 76.00(6dB) 75.63(99%)	**Complied**
Maximum Output Power (dBm)	CFR47 15.407 (a)	22.55dBm (Max combined power 4x4)	**Complied**
Peak Power Spectral Density (dBm)	CFR47 15.407 (a)	Limit 24dBm with 12dBi Antenna Measured 8.58dBm	**Complied**
Conducted Emission – Antenna Port	CFR47 15.407 (b),	30 MHz -40 GHz < 27 dBm/MHz see plots	**Complied**
Frequency Stability	CFR47 15.407 (g)	Limit ±20 ppm Measured: 10.89ppm	**Complied**
RF Exposure	CFR47 15.247 (i), 2.1091	General Population	**Complied**

Note: This test report covers 5725 MHz to 5850MHz band.

1.4 Special Accessories

No special accessories were necessary in order to achieve compliance.

1.5 Equipment Modifications

None

2 Laboratory Information

2.1 Accreditations & Endorsements

2.1.1 US Federal Communications Commission

TUV Rheinland of North America at 1279 Quarry Ln, Pleasanton, CA 94566 is recognized by the commission for performing testing services for the general public on a fee basis. These laboratory test facilities have been fully described in reports submitted to and accepted by the FCC (US5254). The laboratory scope of accreditation includes: Title 47 CFR Parts 15, 18, and 90. The accreditation is updated every 3 years.

2.1.2 NIST / A2LA

TUV Rheinland of North America is accredited by the National Voluntary Laboratory Accreditation Program, which is administered under the auspices of the National Institute of Standards and Technology. The laboratory has been assessed and accredited in accordance with ISO Guide 17025:1999 and ISO 9002 (Lab Code Testing Cert #3331.02). The scope of laboratory accreditation includes emission and immunity testing. The accreditation is updated annually.

2.1.3 Canada – Industry Canada

TUV Rheinland of North America at the 1279 Quarry Ln, Pleasanton, CA 94566 address is accredited by Industry Canada for performing testing services for the general public on a fee basis. This laboratory test facilities have been fully described in reports submitted to and accepted by Industry Canada (File Number 2932M). This reference number is the indication to the Industry Canada Certification Officers that the site meets the requirements of RSS 212, Issue 1 (Provisional). The accreditation is updated every 3 years.

2.1.4 Japan – VCCI

The Voluntary Control Council for Interference by Information Technology Equipment (VCCI) is a group that consists of Information Technology Equipment (ITE) manufacturers and EMC test laboratories. The purpose of the Council is to take voluntary control measures against electromagnetic interference from Information Technology Equipment, and thereby contribute to the development of a socially beneficial and responsible state of affairs in the realm of Information Technology Equipment in Japan. TUV Rheinland of North America at 1279 Quarry Ln, Pleasanton, CA 94566 has been assessed and approved in accordance with the Regulations for Voluntary Control Measures.

VCCI Registration No. for Pleasanton: A-0031

VCCI Registration No. for Santa Clara: A-0032

2.1.5 Acceptance by Mutual Recognition Arrangement

The United States has an established agreement with specific countries under the Asia Pacific Laboratory Accreditation Corporation (APLAC) Mutual Recognition Arrangement. Under this agreement, all TUV Rheinland at 1279 Quarry Ln, Pleasanton, CA 94566 test results and test reports within the scope of the laboratory NIST / A2LA accreditation will be accepted by each member country.

2.2 Test Facilities

All of the test facilities are located at 1279 Quarry Lane, Pleasanton, California 94566, USA. The 2305 Mission College, Santa Clara, 95054, USA location is considered a Pleasanton annex.

2.2.1 Emission Test Facility

The Semi-Anechoic chamber and AC Line Conducted measurement facility used to collect the radiated and conducted data has been constructed in accordance with ANSI C63.7:1992. The site has been measured in accordance with and verified to comply with the theoretical normalized site attenuation requirements of ANSI C63.4-2009, at a test distance of 3 and 5 meters. The site is listed with the FCC and accredited by A2LA (Lab Code Testing Cert #3331.02). The 3/5-meter semi-anechoic chamber used to collect the radiated data has been verified to comply with the theoretical normalized site attenuation requirements of ANSI C63.4-2009, at a test distance of 3 meter and 5 meters. A report detailing this site can be obtained from TUV Rheinland of North America.

2.2.2 Immunity Test Facility

ESD, EFT, Surge, PQF: These tests are performed in an environmentally controlled room with a 3.7 m x 4.8 m x 3.175 mm thick aluminum floor connected to PE ground.

For ESD testing, tabletop equipment is placed on an insulated mat with a surface resistivity of 10^9 Ohms/square on a 1.6 m x 0.8 m x 0.8 m high non-conductive table with a 3.175 mm aluminum top (Horizontal Coupling Plane). The HCP is connected to the main ground plane via a low impedance ground strap through two 470-kΩ resistors. The Vertical Coupling Plane consists of an aluminum plate 50 cm x 50 cm x 3.175 mm thick. The VCP is connected to the main ground plane via a low impedance ground strap through two 470-kΩ resistors.

For EFT, Surge, PQF, the HCP and VCP are removed.

RF Field Immunity testing is performed in a 7.3m x 4.3m x 4.1m anechoic chamber.

RF Conducted and Magnetic Field Immunity testing is performed on a 4.8m x 3.7m x 3.175mm thick aluminum ground plane.

All test areas allow a minimum distance of 1 meter from the EUT to walls or conducting objects.

2.3 Measurement Uncertainty

Two types of measurement uncertainty are expressed in this report, per *ISO Guide To The Expression Of Uncertainty In Measurement*, 1st Edition, 1995.

The Combined Standard Uncertainty is the standard uncertainty of the result of a measurement when that result is obtained from the values of a number of other quantities; it is equal to the positive square root of the sum of the variances or co-variances of these other quantities, weighted according to how the measurement result varies with changes in these quantities. The term *standard uncertainty* is the result of a measurement expressed as a standard deviation.

2.3.1 Sample Calculation – radiated & conducted emissions

The field strength is calculated by subtracting the Amplifier Gain and adding the Cable Loss and Antenna Correction Factor to the measured reading. The basic equation is as follows:

Field Strength (dBμV/m) = RAW - AMP + CBL + ACF

Where: RAW = Measured level before correction (dBμV)

AMP = Amplifier Gain (dB)

CBL = Cable Loss (dB)

ACF = Antenna Correction Factor (dB/m)

$$\mu V/m = 10^{\frac{dB\mu V/m}{20}}$$

Sample radiated emissions calculation @ 30 MHz

Measurement +Antenna Factor–Amplifier Gain+Cable loss=Radiated Emissions (dBuV/m)

25 dBuV/m + 17.5 dB – 20 dB + 1.0 dB = 23.5 dBuV/m

2.3.2 Measurement Uncertainty

Per CISPR 16-4-2	**U_{lab}**	**U_{cispr}**
Radiated Disturbance @ 10 meters		
30 – 1,000 MHz	2.25 dB	4.51 dB
Radiated Disturbance @ 3 meters		
30 – 1,000 MHz	2.26 dB	4.52 dB
1 – 6 GHz	2.12 dB	4.25 dB
6 – 18 GHz	2.47 dB	4.93 dB
Conducted Disturbance @ Mains Terminals		

150 kHz – 30 MHz	1.09 dB	2.18 dB
Disturbance Power		
30 MHz – 300 MHz	3.92 dB	4.3 dB

Voltech PM6000A

The estimated combined standard uncertainty for harmonic current and flicker measurements is ± 5.0%.	Per CISPR 16-4-2 Methods

2.3.1 Measurement Uncertainty Immunity

The estimated combined standard uncertainty for ESD immunity measurements is ± 8.2%.	Per IEC 61000-4-2
The estimated combined standard uncertainty for radiated immunity measurements is ± 4.10 dB.	Per IEC 61000-4-3
The estimated combined standard uncertainty for conducted immunity measurements with CDN is ± 3.66 dB	Per IEC 61000-4-6
The estimated combined standard uncertainty for power frequency magnetic field immunity is ± 2.9%.	Per IEC 61000-4-8

Thermo KeyTek EMC Pro

The estimated combined standard uncertainty for EFT fast transient immunity measurements is ± 2.6%.
The estimated combined standard uncertainty for surge immunity measurements is ± 2.6%.
The estimated combined standard uncertainty for voltage variation and interruption measurements is ± 1.74%.

The expanded uncertainty at a level of 95% confidence is obtained by multiplying the combined standard uncertainty by a coverage factor of 2. Compliance criteria are not based on measurement uncertainty.

2.4 Calibration Traceability

All measurement instrumentation is traceable to the National Institute of Standards and Technology (NIST). Measurement method complies with ANSI/NCSL Z540-1-1994 and ISO Standard 17025:2005. Equipment calibration records are kept on file at the test facility.

3 Product Information

3.1 Product Description

The Aruba AP-320 Series wireless access points support IEEE 802.11ac standard for high-performance WLAN, and is equipped with two dual-band radios, which can provide access and monitor the network simultaneously. Multi-user Multiple-in, Multiple-output (MU-MIMO) technology allows this access point to deliver high-performance 802.11n 2.4 GHz and 802.11ac 5 GHz functionality, while also supporting 802.11a/b/g/n/ac wireless services.

3.2 Equipment Configuration

A description of the equipment configuration is given in the Test Plan Section. The EUT was tested as called for in the test standard and was configured and operated in a manner consistent with its intended use. The EUT was connected to rated power and allowed to reach intended operating conditions. The placement of the EUT system components was guided by the test standard and selected to represent typical installation conditions.

In the case of an EUT that can operate in more than one configuration, preliminary testing was performed to determine the configuration that produced maximum radiation.

The final configuration was selected to produce the worst case radiation for emissions testing and to place the EUT in the most susceptible state for immunity testing.

3.3 Operating Mode

A description of the operation mode is given in the Test Plan Section. In the case of an EUT that can operate in more than one state, preliminary testing was performed to determine the operating mode that produced maximum radiation.

The final operating mode was selected to produce the worst case radiation for emissions testing and to place the EUT in the most susceptible state for immunity testing.

3.4 Unique Antenna Connector

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited..

3.4.1 Results

The Wireless Access Point Model APIN0325 has 4 internal fixed antennas. Model: APIN0324 has four ports with reverse polarity SMA connector. List of antennas that can be used with this device is in Section 6.3.

4 Emissions

Testing was performed in accordance with CFR 47 Part 15.407: 2014 These test methods are listed under the laboratory's A2LA Scope of Accreditation. This test measures the levels emanating from the EUT, thus evaluating the potential for the EUT to cause radio frequency interference to other electronic devices. Procedures described in section 8 of the standard were used.

4.1 Output Power Requirements

The maximum output power requirement is the maximum equivalent isotropic radiated power delivering at the transmitting antenna under specified conditions of measurements in the presence of modulation.

The maximum output power and harmonics shall not exceed CFR47 Part 15.407 (a):2014

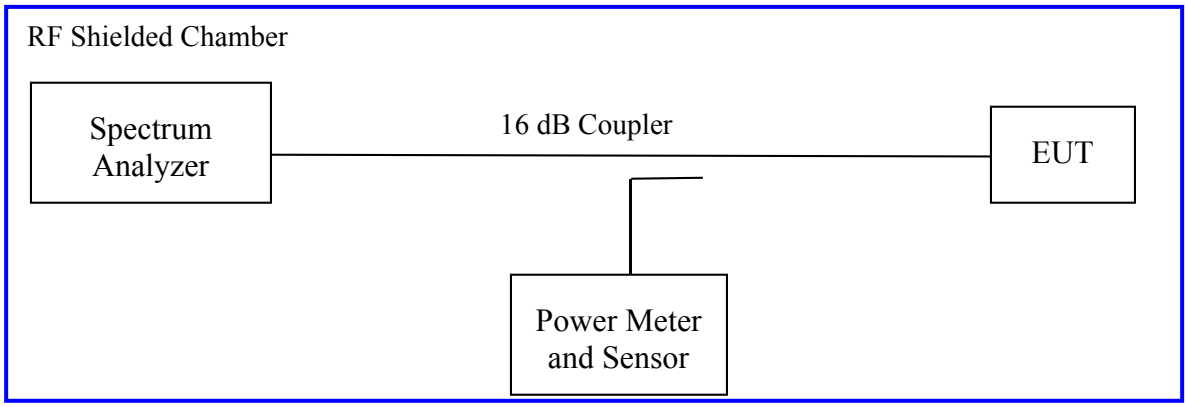
The maximum transmitted powers are

Band 5725-5850 MHz: 1 W

4.1.1 Test Method

The ANSI C63.10-2009 Section 6.10.3.1 conducted method was used to measure the channel power output. The preliminary investigation was performed at different data rate/ chain to determine the highest power output for each mode. The worst findings were conducted on 3 channels in each operating range per CFR47 Part 15.407(a): 2014; 5725 MHz to 5850MHz. The worst mode results indicated below.

Test Setup:



Method SA-1 of "Guidelines for Compliance Testing of Unlicensed National Information Infrastructure (U-NII) Devices" applies since the EUT continuously transmit; where duty cycle is greater than 98%. Sample detector was used.

Each chain was measured individually and applied the measure-and-sum approach per KDB66291.

4.1.2 Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

Table 2: RF Output Power at the Antenna Port – Test Results

Test Conditions: Conducted Measurement, Normal Temperature								
Antenna Type: Integrated & External				**Power Setting:** See test plan				
Min -Max. Directional Gain: +2dBi & +12 dBi				**Signal State:** Modulated at 100%.				
Ambient Temp.: 23° C				**Relative Humidity:**33%				
802.11a Mode, 4x4								
Operating Channel	**Limit [dBm]**	**Ch0 [dBm]**	**Ch1 [dBm]**	**Ch2 [dBm]**	**Ch3 [dBm]**	**CF [dB]**	**Total Power [dBm]**	**Margin [dB]**
5745	27.50	17.44	16.25	15.61	16.43	0.04	22.55	-4.95
5785	27.50	15.99	14.26	14.71	14.81	0.04	21.06	-6.44
5825	27.50	16.96	16.04	14.30	14.20	0.04	21.60	-5.90

Note: 1.The highest output power was observed at 802.11a mode 6.0mbps, 4 Data Streams. **Power setting 17** was used above measurements

2. All chains will be on at all time. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911.

3. The highest gain of antennas used 8.5dBi. As Per CFR47 Part 15.407 (a) the limit is reduced for every1 dB gain exceeding 6dBi, limit will be 27.5dBm. No beamforming is considered for this mode. List of antennas is given Section 6.3 of this report.

Note: Highlighted plots are available in this report

Table 3: Output Power at the Antenna Port –

Test Conditions: Conducted Measurement, Normal Temperature								
Antenna Type: Integrated & External					**Power Setting:** See test plan			
Min-Max. Directional Gain: +2dBi & +12 dBi					**Signal State:** Modulated at 100%.			
Ambient Temp.: 23 °C					**Relative Humidity:**33%			
802.11n (HT20/ VHT20) Mode, 4x4;								
Operating Channel	**Limit [dBm]**	**Ch0 [dBm]**	**Ch1 [dBm]**	**Ch2 [dBm]**	**Ch3 [dBm**	**CF [dB]**	**Total Power [dBm]**	**Margin [dB]**
5745	24.00	14.27	16.02	15.18	15.00	0.34	21.53	-2.47
5785	24.00	16.52	15.51	15.02	14.12	0.34	21.74	-2.26
5825	24.00	14.57	14.11	13.78	13.47	0.34	20.37	-3.63

Note: 1. The highest output power was observed at HT20 6.5 Mbps, 4 Data Streams.

2. **The above measurement are taken with PS17**. All chains will be on at all time and beam performing. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911

3. The total directional gain for APIN0325 Unit with internal Antennas would be 9.0dBi; with Antenna gain: 5.5 dBi and directional gain 3.5dBi As Per CFR47 Part 15.407 (a) the limit is reduced for every1 dB gain exceeding 6dBi, limit will be 27.0dBm

5. For APIN0324unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 8.5dBi, and with Beam forming ON are 8.5dBi and 12dBi. The limit will be 24.00dBm with 12dBi with max antenna gain.

6. **The power limit above is with highest gain antenna with beamforming on**. **Power setting 17** was used above measurements. List of antennas is given Section 6.3 of this report.

Note: Highlighted plots are available in this report

802.11n (HT40/VHT40) Mode, 4x4								
Operating Channel	**Limit [dBm]**	**Ch0 [dBm]**	**Ch1 [dBm]**	**Ch2 [dBm]**	**Ch3 [dBm]**	**CF [dB]**	**Total Power [dBm]**	**Margin [dB]**
5755	24.00	16.43	15.43	14.34	14.69	0.46	21.78	-2.22
5795	24.00	15.92	15.90	16.91	16.56	0.46	22.83	-1.17

Note: 1. The highest output power was observed at HT20 6.5 Mbps, 4 Data Streams.

2. All chains will be on at all time and beam performing. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911

3. The total directional gain for 0325 Unit with internal Antennas would be 9.0dBi;

Antenna gain: 5.5 dBi and directional gain 3.5dBi

4. As Per CFR47 Part 15.407 (a), the limit is reduced for every1 dB gain exceeding 6dBi. The limit would be 27.0dBm. Beam forming turned off the limit will be 30dBm

5. For 0324 unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 8.5dBi, and with Beam forming ON are 8dBi and 12dBi. The limit will be 24.00dBm with 12dBi with max antenna gain.

6. **Power setting 16** was used for above measurements. List of antennas is given Section 6.3 of this report.

Note: Highlighted plots are available in this report

802.11AC (VHT80) Mode, 4x4								
Operating Channel	**Limit [dBm]**	**Ch0 [dBm]**	**Ch1 [dBm]**	**Ch2 [dBm]**	**Ch3 [dBm]**	**CF [dB]**	**Total Power [dBm]**	**Margin [dB]**
5775	24.00	14.77	14.64	15.30	14.10	1.22	21.96	-2.04

Note: 1.The highest output power was observed at HT80 Mbps, 4 Data Streams. Plots for all the measurements stated above were taken, to reduce complexity and bulkiness of the report. Only Highlighted Plots are placed in the report.
2. All chains will be on at all time and beam performing. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911
3. The total directional gain for 0325 Unit with internal Antennas would be 9.0dBi;
Antenna gain: 5.5 dBi and directional gain 3.5dBi
4. As Per CFR47 Part 15.407 (a), the limit is reduced for every1 dB gain exceeding 6dBi. The limit would be 27.0dBm. Beam forming turned off the limit will be 30dBm
5. For 0324 unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 8.5dBi, and with Beam forming ON are 8dBi and 12dBi. The limit will be 24.00dBm with 12dBi with max antenna gain.
6. **Power setting 16** was used for above measurements. List of antennas is given Section 6.3 of this report.

4.2 Occupied Bandwidth

The occupied bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency.

The 99% bandwidth is the bandwidth in which 99% of the transmitted power occupied.

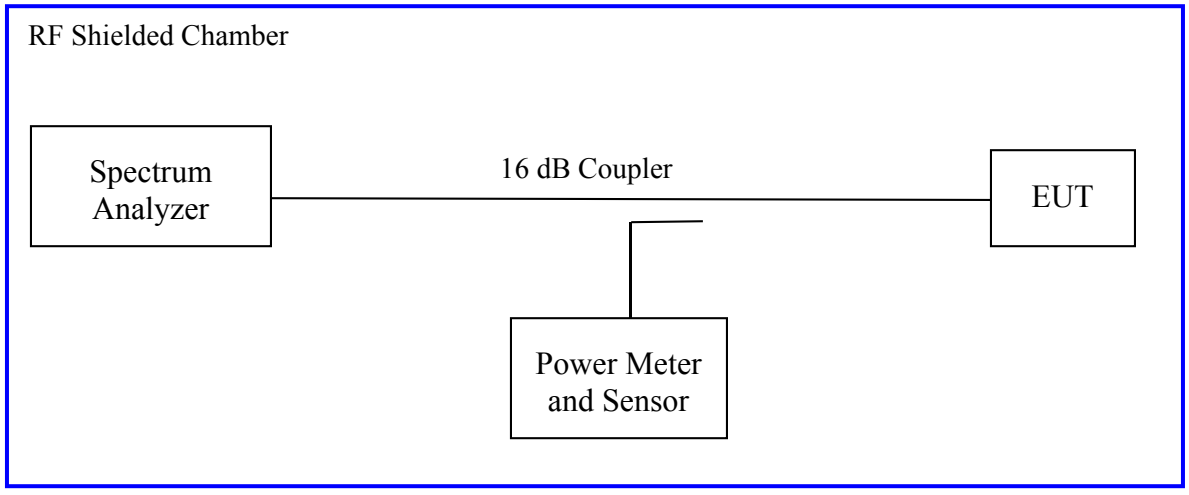
The 6dB bandwidth is defined the bandwidth of 6 dBr from highest transmitted level of the fundamental frequency.

There is no restriction limits for the bandwidth. The 6dB bandwidth was used to determine the limit for maximum conducted output power per CFR47 Part 15.407(a).

4.2.1 Test Method

The conducted method was used to measure the occupied bandwidth. The measurement was performed with modulation per CFR47 15.407(a) 2014. The preliminary investigation was performed to find the narrowest 26 dB bandwidth for each operational mode at different data rates. This worst finding was performed on 3 channels in each operating frequency range; 5725 MHz to 5850MHz. The worst results indicated below.

Test Setup:



4.2.2 Results

These occupied bandwidth measurements were taken for references only.

Table 4: Occupied Bandwidth – Test Results

Test Conditions: Conducted Measurement, Normal Temperature and Voltage only								
Antenna Type: Integrated & External				**Power Setting:** See Test Plan				
Min-Max. Directional Gain: +2dBi & +12 dBi				**Signal State:** Modulated at 100%.				
Ambient Temp.: 21 °C				**Relative Humidity:**33%

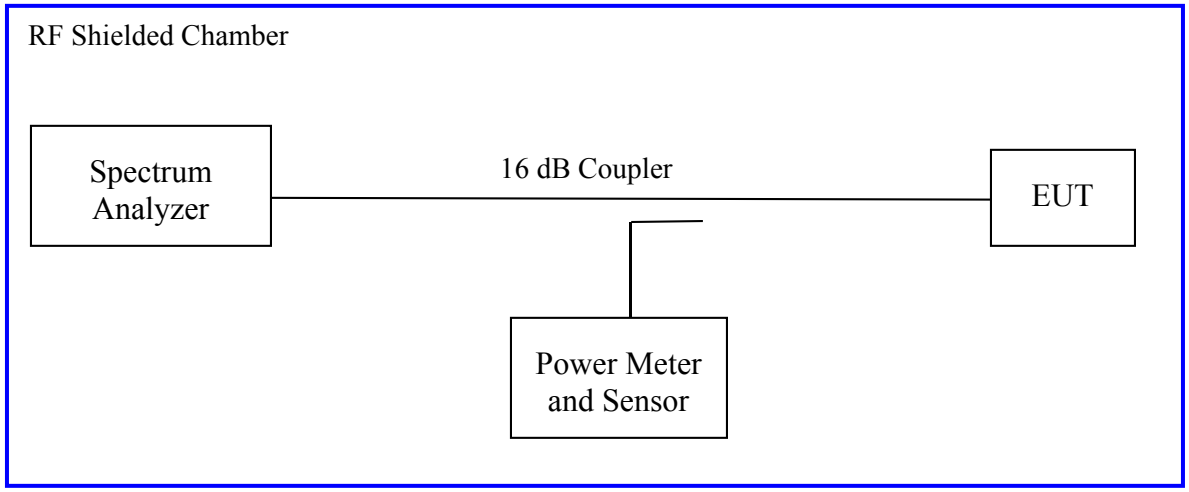
4.3 Peak Power Spectral Density

According to the CFR47 Part 15.407 (a) the spectral power density output of the antenna port shall be less than 30dBm in any 1 MHz band during any time interval of continuous transmission.

4.3.1 Test Method

The conducted method was used to measure the channel power output per ANSI C63.10-2009 Section 6.11.2. The measurement was performed with modulation per CFR47 Part 15.407 (a). Pre-evaluation was performed to find the worst modes. The worst findings were conducted on 3 channels in each operating frequency range of 5725 MHz to 5850MHz. The worst sample results are indicated below.

Test Setup:



4.3.2 Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

Table 5: Peak Power Spectral Density – Test Results

Test Conditions: Conducted Measurement, Normal Temperature and Voltage only							
Antenna Type: Integrated & External					**Power Setting:** See Test plan		
Min-Max. Directional Gain: +2dBi & 12 dBi					**Signal State:** Modulated at 100%.		
Ambient Temp.: 23° C					**Relative Humidity:**32%		
Peak Power Spectral Density							
802.11a Mode							
Freq. (MHz)	**CH0 [dBm]**	**CH1 [dBm]**	**CH2 [dBm]**	**CH3 [dBm]**	**Combined PSD [dBm]**	**Limit [dBm]**	**Margin [dB]**
5745	3.92	2.94	2.38	2.34	8.96	27.5	-18.54
5785	2.52	0.82	1.43	1.38	7.60	27.5	-19.90
5825	3.38	2.74	1.41	0.69	8.20	27.5	-19.30

Note: 1. The highest peak output power was observed at 11 a 6.0 MBps per data stream.
2. All chains will be on at all time. PSD were summed in accordance with ANSI C63.10; 2009 per KDB 662911
3. The lowest antenna gain for APIN0325 with internal Antennas would be 5.5 dBi. The directional gain with Beam forming is 3.5dBi. Total directional gain will be 9 dBi.
4. For APIN0325 unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 8.5dBi, and with Beam forming ON are 8.5dBi and 12dBi
5. As Per CFR47 Part 15.407 (a), the limit is reduced for every1 dB gain exceeding 6dBi.
The limit would be 27.5 for max gain antenna of 8.5dBi as shown on the table above.
6. Beamforming was not considered for this mode List of antennas is given Section 6.4 of this report. PSD
7. Highlighted Plots are placed in the report

Peak Power Spectral Density			
802.11 HT20/VHT20 Mode			
Freq. (MHz)	**Total PSD [dBm]**	**Limit [dBm]**	**Margin [dB]**
5745	7.44	24	-16.56
5785	8.58	24	-15.42
5825	7.50	24	-16.50

Note: 1. The highest peak output power was observed at HT20 6.5 Mbps per data stream.
2. All chains will be on at all time and beam performing. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911
3. The lowest antenna gain for APIN0325 with internal Antennas would be 5.5 dBi. The directional gain with Beam forming is 3.5dBi. Total directional gain will be 9 dBi.
4. For APIN0325 unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 7.5dBi, and with Beam forming ON are 8.5dBi and 12dBi
5. As Per CFR47 Part 15.407 (a), the limit is reduced for every1 dB gain exceeding 6dBi.
The limit would be 24.0dBm for max gain antenna of 12dBi as shown on the plot.
6. Total PSD is the combined worst case PSD.
7. **The PSD limit above is for highest gain antenna with Beam Forming ON**. List of antennas is given Section 6.4 of this report.

Peak Power Spectral Density					
802.11 HT40/VHT40 Mode					
Freq. (MHz)	**Total PSD [dBm]**	**CF [dB]**	**Total PSD [dBm]**	**Limit [dBm]**	**Margin [dB]**
5755	5.15	0.46	5.61	24	-18.39
-5795	7.13	0.46	7.59	24	-16.41

Note: 1. The highest peak output power was observed at HT40 13.5Mbps per data stream.
2. All chains will be on at all time and beam performing. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911
3. The lowest antenna gain for APIN0325 with internal Antennas would be 5.5 dBi. The directional gain with Beam forming is 3.5dBi. Total directional gain will be 9 dBi.
4. For APIN0325 unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 7.5dBi, and with Beam forming ON are 8.5dBi and 12dBi
5. As Per CFR47 Part 15.407 (a), the limit is reduced for every1 dB gain exceeding 6dBi. The limit would be 24.0dBm for max gain antenna of 12dBi as shown on the plot.
6. Total PSD is the combined worst case PSD.
7. **The PSD limit above is for highest gain antenna with Beam Forming turned ON**. List of antennas is given Section 6.4 of this report.

802.11n AC (VHT80) Mode					
Freq. (MHz)	**Total PSD [dBm]**	**CF [dB]**	**Max. PPSD [dBm]**	**Limit [dBm]**	**Margin [dB]**
5775	7.82	1.22	9.02	24	-14.98

Note: 1. The highest peak output power was observed at VHT80 58.5 Mbps per data stream.
2. All chains will be on at all time and beam performing. RF output powers were summed in accordance with ANSI C63.10; 2009 per KDB 662911
3. The lowest antenna gain for APIN0325 with internal Antennas would be 5.5 dBi. The directional gain with Beam forming is 3.5dBi. Total directional gain will be 9 dBi.
4. For APIN0325 unit with External antennas minimum and maximum gains beam forming turned OFF are 2dBi and 7.5dBi, and with Beam forming ON are 8.5dBi and 12dBi
5. As Per CFR47 Part 15.407 (a), the limit is reduced for every1 dB gain exceeding 6dBi. The limit would be 24.0dBm for max gain antenna of 12dBi as shown on the plot.
6. Total PSD is the combined worst case PSD.
7. **The PSD limit above is for Highest gain antenna with Beam Forming turned ON**. List of antennas is given Section 6.4 of this report.

Transmitter Spurious Emissions

Transmitter spurious emissions are emissions outside the frequency range of the equipment when the equipment is in transmit mode; per requirement of CFR47 15.205, 15.209, 15.407(b).

4.3.3 Test Methodology

4.3.3.1 Preliminary Test

A test program that controls instrumentation and data logging was used to automate the preliminary RF emission test procedure. The frequency range of interest was divided into sub-ranges to yield a frequency resolution of approximately 120 kHz and provide a reading at each frequency for no more than 12° of turntable rotation. For each frequency sub-range the turntable was rotated 360° while peak emission data was recorded and plotted over the frequency range of interest in horizontal and vertical antenna polarization's.

Preliminary emission profile testing was performed inside the anechoic chamber. The EUT was placed on a 1.0m x 1.5m non-conductive table 80cm above the floor. The EUT was positioned as shown in the setup photographs. The receiving antenna was placed at a distance of 3m at a fixed height of 1m. Measurement equipment was located outside of the chamber. A video camera was placed inside the chamber to view the EUT.

Pres-scans were performed to determine the worst axis, data rate/ chains.

4.3.3.2 Final Test

For each frequency measured, the peak emission was maximized by manipulating the receiving antenna from 1 to 4 meters above the ground plane and placing it at the position that produced the maximum signal strength reading. The turntable was then rotated through 360° while observing the peak signal and placing the EUT at the position that produced maximum radiation. The six highest emissions relative to the limit were measured unless such emissions were more than 20 dB below the limit. If less than six emissions are within 20 dB of the limit, than the noise level of the receiver is measured at frequencies where emissions are expected. Multiples of all oscillator and microprocessor frequencies were also checked.

Final testing was performed on an NSA compliant test site. The EUT was placed on a 1.0m x 1.5m non-conductive table 80cm above the ground plane. The placement of EUT and cables were the same as for preliminary testing and is shown in the setup photographs.

The final scans performed on the worst axis, X-Axis, for three operating channels;

6.0 Mbits/s for 802.11a 5745, 5785 and 5825MHz

6.5 Mbit/s for 802.11n HT20/VHT20 Mode: 5745, 5785 and 5825MHz

13.5 Mbit/s for 802.11n HT40/VHT20 Mode: 5755 and 5795MHz

56.5Mbits/s for 802.11nAC VHT80 Mode 5775MHz

4.3.3.3 Deviations

None.

4.3.4 Transmitter Spurious Emission Limit

The spurious emissions of the transmitter shall not exceed the values in CFR47 Part 15.205, 15.209: 2009 and RSS-247 6.2.4 (2)

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100 **	3
88-216	150 **	3
216-960	200 **	3
Above 960	500	3

According to CFR47 15.407 (b), For transmitters operating in the 5.725-5.85 GHz band: All emissions within the frequency range from the band edge to 10 MHz above or below the band edge shall not exceed an e.i.r.p. of −17 dBm/MHz; for frequencies 10 MHz or greater above or below the band edge, emissions shall not exceed an e.i.r.p. of −27 dBm/MHz. This is equivalent to 78.2dBuV/m and 68.2dBuV/m at 3 meter distance.

4.3.5 Test Results

The final measurement data was taken under the worst case operating modes, configurations, and/or cable positions. It also reflects the results including any modifications and/or special accessories listed in Sections 1.4 and test plan.

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

Table 6: Transmit Spurious Emission at Band-Edge Requirements

Test Conditions: Radiated Measurement, Normal Temperature and Voltage only								
Antenna Type: External: Unit APIN0324				**Power Setting:** See test plan				
Max. Directional Gain:				**Signal State:** Modulated at 100%.				
Ambient Temp.: 23° C				**Relative Humidity:**33%				
Band-Edge Results								
Freq. (MHz)	Level (dBuV/m)	Polarity (H/V)	Limit (dBuV/m)	Margin (dB)	Det.	Table (deg)	Ant Ht (mts)	Note
5715.68	67.28	V	68.2	−0.92	Pk	125	144	11a TX 5745 PS17 Band Crossing
5713.68	67.99	V	68.2	−0..21	Pk	28	190	HT20 5745 PS17 Band crossing
5704.66	67.41	V	68.2	−0.79	Pk	167	173	HT40 5755 PS16 Band crossing
5711.27	66.40	V	68.2	−1.80	Pk	167	173	HT80 5775 PS9 Band crossing

Note: 1. Complies with the -27dBm/MHz (68.2dBuV/m at 3m) requirements as stated in CFR47 15.407 (b) (1) to 15.407 (b) (3) at Band edge Freq. 5725MHz.

3. Both antenna polarizations were evaluated vertical antenna polarization with higher emissions is reported here.

2. Both devices were tested worst case results with unit high gain External antennas APIN0324 are reported here.

Notes:

4.3.6 Sample Calculation

The field strength is calculated by subtracting the Amplifier Gain and adding the Cable Loss and Antenna Correction Factor to the measured reading. The basic equation is as follows:

Field Strength (dBµV/m) = FIM - AMP + CBL + ACF

Where: FIM = Field Intensity Meter (dBµV)
AMP = Amplifier Gain (dB)
CBL = Cable Loss (dB)
ACF = Antenna Correction Factor (dB/m)

$$\mu V/m = 10^{\frac{dB\mu V/m}{20}}$$

4.4 AC Conducted Emissions

Testing was performed in accordance with ANSI C63.4: 2010. These test methods are listed under the laboratory's A2LA Scope of Accreditation.

This test measures the levels emanating from the EUT's AC input port, thus evaluating the potential for the EUT to cause radio frequency interference to other electronic devices.

The AC conducted emissions of equipment under test shall not exceed the values in CFR47 Part 15.207: 2012.

4.4.1 Test Methodology

A test program that controls instrumentation and data logging was used to automate the AC Power Line Conducted emission test procedure. The frequency range of interest was divided into sub-ranges such as to yield a frequency resolution of 9 kHz. Each phase and neutral of the AC power line were measured with respect to ground. Measurements were performed using a set of 50µH / 50Ω LISNs.

Testing is either performed in Lab 2. The setup photographs clearly identify which site was used. The vertical ground plane used in the semi-anechoic chamber is a 2m x 2m solid aluminum frame and panel, and it is bonded to the horizontal ground plane.

In the case of tabletop equipment, the EUT is placed on a 1.0m x 1.5m non-conductive table 80cm above the ground plane and 40cm from a vertical ground reference plane. The rear of the EUT was positioned flush with the backside of the table and directly over the LISNs. The power and I/O cables were routed over the edge of the table and bundled approximately 40cm from the ground plane. Support equipment was powered from a separate LISN.

4.4.1.1 Deviations

There were no deviations from this test methodology.

4.4.2 Test Results

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

4.5 Frequency Stability

In accordance with 47 CFR Part 15.407(g) the frequency stability of U-NII devices must be such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual. The Manufacturer calls out operating temperature ranges of +0º to +40º C

4.5.1 Test Methodology

The manufacturer of the equipment is responsible for ensuring that the frequency stability is such that emissions are always maintained within the band of operation under all conditions. This test performs according to ANSI C63.10-2009 Section 6.8

4.5.2 Manufacturer Declaration

The frequency stability of the reference oscillator sets the frequency stability of the RF transceiver signals. Therefore all of the RF signal should have ±20 ppm stability.

This stability accounts for room temp tolerance of the crystal oscillator circuit, frequency variation across temperature, and crystal ageing.

Worst case:
5.200 GHz - ±20 ppm/104 kHz

±20 ppm at 5 GHz translates to a maximum frequency shift of ±103 kHz. As the edge of the channels are at least one MHz from either of the band edges, ±103 kHz is more than sufficient to guarantee that the intentional emission will remain in the band over the entire operating range of the radio.

4.5.3 Limit

CFR47 Part 407(g) - Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual.

4.5.4 Test results:

Temperature	Time	PPM
0°C	Start	5.76
	2 Min.	2.88
	5 Min	5.40
	10 min	3.24
10°C	Start	10.45
	2 Min.	6.12
	5 Min	3.24
	10 min	5.40
20°C	Start	1.44
	2 Min.	2.16
	5 Min	1.80
	10 min	5.40
30°C	Start	2.16
	2 Min.	8.65
	5 Min	1.08
	10 min	4.68
40°C	Start	2.88
	2 Min.	2.16
	5 Min	0.36
	10 min	9.73
50°C	Start	11.89
	2 Min.	1.80
	5 Min	2.52
	10 min	9.37

Note: 1. All frequency drifts were less than ±20 ppm. The worst frequency drift was 11.89 ppm/ 62kHz. 2. Channel 5200MHz was selected to frequency stability.

Figure 32: Frequency Stability at 5200MHz 11a mode at 6Mbps

4.6 Voltage Variation

In accordance with 47 CFR Part 15.31 (e) intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

4.6.1 Test Methodology

The ac supply voltage was varied between 85% and 115% of the nominal rated supply voltage. The fundamental frequency was observed during the variation. The access point was powered 12V DC by programmable power supply. The voltage was varied from 10.6VDC to 13.5VDC while the Center frequencies were observed and record for the maximum drift in ppm; part per millions.

4.6.2 Test results

Frequency MHz	Nominal (12VDC) MHz	Low Voltage (10.6 VDC) MHz	High Voltage (13.5VDC) MHz	Max Drift ppm
5200	5199.927	5199.996	5199.994	14.0 (73KHz)

Figure 33: Frequency Stability at 5200MHz 11a mode at 6Mbps

4.7 Maximum Permissible Exposure

4.7.1 Test Methodology

In this document, we try to prove the safety of radiation harmfulness to the human body for our product. The limit for Maximum Permissible Exposure (MPE) specified in FCC 1.1310 is followed. The Gain of the antenna used in this calculation is declared by the manufacturer, and the maximum total power input to the antenna is measured. Through the Friis transmission formula and the maximum gain of the antenna, we can calculate the distance, away from the product, where the limit of MPE is reached.

Although the Friis transmission formula is a far field assumption, the calculated result of that is an over-prediction for near field power density. We will take that as the worst case to specify the safety range.

4.7.2 RF Exposure Limit

According to FCC 1.1310 table 1: The criteria listed in the following table shall be used to evaluate the environmental impact of human exposure to radio-frequency (RF) radiation as specified in 1.1307(b)

LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (A/m)	Power Density (mW/cm^2)	Average Time (minutes)
(A)Limits For Occupational / Control Exposures

1500 - 100,000	…	…	1.0	30

F = Frequency in MHz * = Plane-wave equivalent power density

4.7.3 EUT Operating Condition

The software provided by Manufacturer enabled the EUT to transmit data at lowest, middle and highest channel individually.

4.7.4 Classification

The antenna of the product, under normal use condition, is at least 20cm away from the body of the user. Warning statement to the user for keeping at least 20cm or more separation distance with the antenna should be included in user's manual. So, this device is classified as a **Mobile Device**.

4.7.5 Test Results

4.7.5.1 Antenna Gain

The transmitting antenna was integrated. The directional antenna gain was +12.00dBi or 15.84 (numeric).

These calculations are based UNII -1 band power and antenna gains (UNII band 1 has highest power for this device)

4.7.5.2 Output Power into Antenna & RF Exposure value at distance 20cm:

Calculations for this report are based on highest power measurement.

Limit for MPE (from FCC part 1.1310 table1) is 1.0 mW/cm^2

The highest measured total power is +24.76 dBm or 299mW

Using the Friss transmission formula, the EIRP is Pout*G, and R is 20cm.

Pd = (299*15.84) / (1600π) = 0.9422 mW/cm2, which is 0.057mW/cm2 below to the limit.

As originally tested, the EUT was found to be compliant to the requirements of the test standard(s).

4.7.6 Sample Calculation

The Friss transmission formula: $Pd = (Pout*G) / (4*\pi*R^2)$

Where;

Pd = power density in mW/cm_2
Pout = output power to antenna in mW
G = gain of antenna in linear scale
$\pi \approx 3.1416$
R = distance between observation point and center of the radiator in cm

* Calibration of equipment past due for re-calibration will be performed expeditiously. If any equipment is found to be out of tolerance at that time, affected customers will be notified accordingly.

6 EMC Test Plan

6.1 Introduction

This section provides a description of the Equipment Under Test (EUT), configurations, operating conditions, and performance acceptance criteria. It is an overview of information provided by the manufacturer so that the test laboratory may perform the requested testing.

6.2 Customer

Table 8: Customer Information

Company Name	Aruba Networks
Address	1344 Crossman Ave.
City, State, Zip	Sunnyvale, CA 94089
Country	USA
Phone	(408) 990- 2557

Table 9: Technical Contact Information

Name	Robert Hastings

Transmitted Spurious Emission (30 MHz – 1GHz) FCC Part 15.205, 15.209, 15.407(b)	Band U-NII 3: 5745, 5785, 5825MHz 4Streams – 6.0 and 6.5Mbps/ stream Test performed highest power (mid channel) of each band	Band U-NII 3: 5755, 5795 4Streams –13.5Mbps/ stream Test performed highest power (mid channel) of each band	Band U-NII 3: 5775 4Streams – 56.5Mbps/ stream Test performed highest power (mid channel) of each band
Transmitted Spurious Emission (Above 1GHz) FCC Part 15.205, 15.209, 15.407(b)	Band U-NII 3: 5745, 5785, 5825MHz 4Streams – 6.0 and 6.5Mbps/ stream Test performed with Highest gain Antenna of each type.	Band U-NII 3: 5755, 5795 4Streams –13.5Mbps/ stream Test performed with Highest gain Antenna of each type.	Band U-NII 3: 5775 4Streams – 56.5Mbps/ stream Test performed with Highest gain Antenna of each type.
Conducted Spurious Emission (antenna port). FCC Part 15.407 (b)	Transmitters operating in the 5.725-5.85 GHz band: All emissions within the frequency range from the band edge to 10 MHz above or below the band edge shall not exceed an e.i.r.p. of −17 dBm/MHz; for frequencies 10 MHz or greater above or below the band edge, emissions shall not exceed an e.i.r.p. of −27dBm/MHz. This is equivalent to 78.2dBuV/m and 68.2dBuV/m at 3 meter distance. The EUT is satisfied the requirement by meeting the limit under CFR47 Part 15.209.		
AC Conducted Emission FCC Part 15.207		5200 MHz at 4 Data Stream: 6.0Mbp	

Test	802.11a/ HT20/VHT20	802.11n HT40/VHT40	802.11n AC VHT80
Frequency Stability FCC Part 15.407 (g)	at 5200 MHz, 4 data streams HT20 mode 6.5Mbps		
Voltage Variation FCC Part 15.31 (e)	at 5200 MHz, 4 data streams HT20 mode 6.5Mbps,		

Note: 1. All radiated emission performed on X-Axis.
2. All four chains will be on at all time.
3. All tests were pre-scanned for worst case before final testing. Test report shows only final readings
