Note:

1, The EUT supports Cyclic Delay Diversity (CDD) mode, and CDD signals are correlated.

If all antennas have the same gain, G_{ANT} , Directional gain = G_{ANT} + Array Gain, where Array Gain is as follows.

• For power spectral density (PSD) measurements on all devices, Array Gain = 10 log (N_{ANT}/ N_{SS}) dB = 3.01;

• For power measurements on IEEE 802.11 devices, Array Gain = 0 dB for $N_{ANT} \le 4$;

2, The EUT also supports Beam Forming mode, and the Beam Forming support 802.11n/ac/ax/be, not

include 802.11a/b/g.

3, The antenna specification is provided by the applicant.

4, These antennas are cross polarized design and the detail refers to antenna specification.

5, Low gain antenna (AP-ANT-312) was selected to perform all RF testing that can got maximum power

setting, high gain different type antenna (AP-ANT-340 & AP-ANT-348) was selected to perform radiated

spurious emission and band edge testing. High gain antenna power setting will be reduced according to difference value of antenna gain declared by applicant.

Limits For Maximum Permissible Exposure (MPE)

f= frequency in MHz. * = Plane-wave equivalent power density.

2.2. MPE Exemptions

For single RF sources (i.e., any single fixed RF source, mobile device, or portable device, as defined in paragraph §1.1307(b)(2) of this section): A single RF source is exempt if:

(Option A) The available maximum time-averaged power is no more than 1 mW, regardless of separation distance. This exemption may not be used in conjunction with other exemption criteria other than those in paragraph §1.1307(b)(3)(ii)(A) of this section.

Medical implant devices may only use this exemption and that in paragraph §1.1307(b)(3)(ii)(A);

(Option B) Or the available maximum time-averaged power or effective radiated power (ERP), whichever is greater, is less than or equal to the threshold P (mW) described in the following formula. This method shall only be used at separation distances (cm) from 0.5 centimeters to 40 centimeters and at frequencies from 0.3 GHz to 6 GHz (inclusive). P is given by:

 $P th(mW) = \{ERP_{20cm}(d / 20cm)^{x} d \le 20cm\}$

 $P th(mW) = \{ERP_{20cm} \ 20cm < d \le 40cm$

Where

 $x = -\log_{10}\left(\frac{60}{ERP_{20}cm\sqrt{f}}\right)$ and f is in GHz;

and

 $ERP_{20cm}(mW) = \{2040f \ 0.3GHz \le f < 1.5GHz \\ ERP_{20cm}(mW) = \{3060 \ 1.5GHz \le f \le 6GHz \}$

(**Option C**) Or using Table 1 and the minimum separation distance (R in meters) from the body of a nearby person for the frequency (f in MHz) at which the source operates, the ERP (watts) is no more than the calculated value prescribed for that frequency. For the exemption in Table 1 to apply, R must be at least $\lambda/2\pi$, where λ is the free-space operating wavelength in meters. If the ERP of a single RF source is not easily obtained, then the available maximum time-averaged power may be used in lieu of ERP if the physical dimensions of the radiating structure(s) do not exceed the electrical length of $\lambda/4$ or if the antenna gain is less than that of a half-wave dipole (1.64 linear value).

| RF Source Frequency (MHz) | Threshold ERP (watts) |
|---------------------------|------------------------------------|
| 0.3-1.34 | 1920R ² |
| 1.34-30 | 3450R ² /f ² |
| 30-300 | 3.83R ² |
| 300-1,500 | 0.0128R ² f |
| 1,500-100,000 | 19.2R ² |

Table 1 to §1.1307(b)(3)(i)(C) - Single RF Sources Subject to Routine Environmental Evaluation

For multiple RF sources: Multiple RF sources are exempt if:

(A) The available maximum time-averaged power of each source is no more than 1 mW and there is a separation distance of two centimeters between any portion of a radiating structure operating and the nearest portion of any other radiating structure in the same device, except if the sum of multiple sources is less than 1 mW during the time-averaging period, in which case they may be treated as a single source (separation is not required). This exemption may not be used in conjunction with other exemption criteria other than those is paragraph \$1.1307(b)(3)(i)(A) of this section. Medical implant devices may only use this exemption and that in paragraph \$1.1307(b)(3)(i)(A).

(B) in the case of fixed RF sources operating in the same time-averaging period, or of multiple mobile or portable RF sources within a device operating in the same time averaging period, if the sum of the fractional contributions to the applicable thresholds is less than or equal to 1 as indicated in the following equation.

$$\sum_{i=1}^{a} \frac{P_i}{P_{th,i}} + \sum_{j=1}^{b} \frac{ERP_j}{ERP_{th,j}} + \sum_{k=1}^{c} \frac{Evaluated_k}{Exposure\ Limit_k} \le 1$$

1.

Where:

a = number of fixed, mobile, or portable RF sources claiming exemption using paragraph (1.1307(b))(3)(i)(B) of this section for P_{th} , including existing exempt transmitters and those being added.

b = number of fixed, mobile, or portable RF sources claiming exemption using paragraph §1.1307(b)(3)(i)(C) of this section for Threshold ERP, including existing exempt transmitters and those being added.

c = number of existing fixed, mobile, or portable RF sources with known evaluation for the specified minimum distance including existing evaluated transmitters.

*P*_i = the available maximum time-averaged power or the ERP, whichever is greater, for fixed, mobile, or

portable RF source *i* at a distance between 0.5 cm and 40 cm (inclusive).

 $P_{th,i}$ = the exemption threshold power (P_{th}) according to paragraph §1.1307(b)(3)(i)(B) of this section for fixed, mobile, or portable RF source *i*.

ERP_j = the ERP of fixed, mobile, or portable RF source j.

ERP_{th,j} = exemption threshold ERP for fixed, mobile, or portable RF source *j*, at a distance of at least $\lambda/2\pi$ according to the applicable formula of paragraph §1.1307(b)(3)(i)(C) of this section.

Evaluated_k = the maximum reported SAR or MPE of fixed, mobile, or portable RF source k either in the device or at the transmitter site from an existing evaluation at the location of exposure.

*Exposure Limit*_{*k*} = either the general population/uncontrolled maximum permissible exposure (MPE) or specific absorption rate (SAR) limit for each fixed, mobile, or portable RF source *k*, as applicable from §1.1310 of this chapter.

| 5G Wi-Fi | 5150 ~ 5895 | 26.00 | 3.3 | 27.15 | 518.80 |

Notes:

- 1. Tune-up power was declared by manufacturer.
- 2. Tune-up ERP = Tune up Conducted Power + Antenna Gain 2.15.

For BLE/ZigBee/2.4G Wi-Fi/5G Wi-Fi, Option B

| Test Mode | Frequency Band | R | Tune-up ERP | Threshold ERP |
|------------------------|----------------|------|-------------|---------------|
| | (MHz) | (m) | (mW) | (mW) |
| BLE (Core 0) | 2400 ~ 2483.5 | 0.22 | 44.16 | 3060.0 |
| BLE (Core 1) | 2400 ~ 2483.5 | 0.22 | 38.46 | 3060.0 |
| ZigBee (Core 0) | 2400 ~ 2483.5 | 0.22 | 44.16 | 3060.0 |
| ZigBee (Core 1) | 2400 ~ 2483.5 | 0.22 | 38.46 | 3060.0 |
| 2.4G Wi-Fi | 2400 ~ 2483.5 | 0.22 | 484.17 | 3060.0 |
| 5G Wi-Fi | 5150 ~ 5895 | 0.22 | 518.80 | 3060.0 |
| Note: R is from user n | nanual. | | | |

For multiple RF sources

- 1, BLE and ZigBee from one radio can't transmit simultaneously.
- 2, Two BLE can transmit simultaneously and two ZigBee can't transmit simultaneously.
- 3, Wi-Fi 2.4G, 5GHz can transmit simultaneously.

The worst-case combination is Core 0 ZigBee + Core 1 BLE + Wi-Fi 2.4G + Wi-Fi 5G.

So the Max Simultaneous Transmission = 44.160 / 3060 + 38.46 / 3060 + 484.17 / 3060 + 518.80 / 3060 = 0.35 < 1

CONCLUSION:

The device qualifies for RF exposure test exemption at 22cm distance.
