

INTERTEK TESTING SERVICES

For Maximum Permissible Exposure (MPE) evaluation of the device, the maximum power density at 20 cm from this mobile transmitter shall be less than the General Population / Uncontrolled MPE limit in OET Bulletin 65.

For the device of tested model of ELS915, the maximum conducted power measured was 0.402 mW. From these data, the exposed power density at a distance (R) of 20cm from the center of radiation of the antenna can be calculated according to OET Bulletin 65 as follow:

The conducted power = 0.402 mW

The power density at 20 cm from the antenna
= $EIRP / 4\pi R^2$
= 0.00008 mW cm⁻²

In the frequency range of 902-928 MHz, the MPE limit is 0.6 mWcm⁻² for general population and uncontrolled exposure. As the measured power density at 20cm from the transmitter is lower than the MPE limit, the compliance to the MPE limit can be ensured by indicating the minimum 20cm separation between the transmitter's radiating structures and body of the user or nearby persons.

The following RF exposure statement is proposed to be included in the user manual:

“ FCC RF Radiation Exposure Statement

Caution: To maintain compliance with the FCC's RF exposure guidelines, place the unit at least 20cm from nearby persons.”
