RE: FCC ID: QA5-HAB-03002
Attention: Ellis Wu

I have a few comments on this Application.

1. The operational description states that two antennae are used with this transmitter. The description also states that reverse SMA are used on both antennae. Please note that while the end of the cable that goes to the PCMCIA card uses reverse SMA, the other end of the cable which connects to the patch antenna itself appears to be a different type. Please verify that this is a non-standard antenna connector. **x**
2. Please note that the manual (page 8) states only one 5dBi antenna is used with the device. The operational description and the photos show two antennae and the MPE is calculated using a 12dBi antenna. Please reconcile the manual, MPE and operational description antenna statements. **ok**
3. Please note that the manual says the device can be used in other than the US. While the manual says 11 channels are useable in the US, there is nothing that indicates that the device cannot be made to operate on non-US channels for US devices. Please provide evidence that the user of the device cannot make the device, by either software or other, operate on any non-US frequency. This may be done by attesting to this fact.
4. Please verify that the length of antenna wire used in radiated testing is the actual length of antenna wire that will be provided with the transmitter. **x**
5. FYI – no action needed. Please note that the reduction in power for antennae over 6dBi applies to a conducted power level of 30dBm. This means that reduction in power does not have to occur until the 36dB point. Since your device is only 20dBm the reduction does not have to occur until a 16dBi antenna is used. No reduction in power is needed if only a 12dBi antenna is used.
