

Tim,

3) We will add the test data into our report and provide it to you as soon as possible.

4) 24.232 is for EIRP, not for conducted power. Page 13 is the conducted power. We are sure that we measure the PEAK transmit power for ERP/EIRP in page 19 and 20 of our report.

5) The connector labeled #14 is very common for cell phone products. It's for factory to tune the power, not for end user. And also, all of our conductive tests were tested by this connector.

Thank you!

BR,

Elisa
