2. Information about test item

2-1 Client & Manufacturer

Client Company name	:	DREAMUS COMPANY
Address	:	311, Gangnam-daero, Seocho-gu, Seoul, Republic of Korea
Tel / Fax	:	+82-2-1577-5557 / +82-2-3019-7572
Manufacturer		Avotek Corporation
Address		301, 25, Simin-daero 248beon-gil, Dongan-gu, Anyang-si, Gyeonggi-do, 14067, Republic of Korea
Tel / Fax		+82-31-384-6311 / +82-31-384-6312

2-2 Equipment Under Test (EUT)

Model name	:	PSP21
Serial number	:	Identical prototype
Date of receipt	:	September 30 2021
EUT condition	:	Pre-production, not damaged
Antenna type	:	FPCB Antenna (Max Gain : Right -1.76 dBi, Left -2.27 dBi)
Frequency Range	:	2402 ~ 2480MHz
RF output power	:	Max 9.78 dBm – Conducted
Type of Modulation	:	Pi/4 DQPSK, 8DPSK
Power Source	:	DC 3.7 V
Firmware Version	:	V0.1

2-3 Tested frequency

Bluetooth	LOW	MID	HIGH
Frequency (MHz) BDR, EDR	2402	2441	2480

15.207 /15.107	AC Conducted Emissions	EN 55022	Line Conducted	N/A
15.203	Antenna requirement	−	−	C

Note 1: C=Complies   NC=Not Complies   NT=Not Tested   NA=Not Applicable

Note 2: This product operates only with battery and does not operate during charging.

Note 1: Antenna Requirement

DREAMUS COMPANY FCC ID: QDMPSP21 unit complies with the requirement of §15.203.

The antenna type is PCB Antenna

The sample was tested according to the following specification:
**FCC Parts 15.247; ANSI C-63.4-2014;ANSI C-63.10-2013
*FCC KDB Publication No. 558074 D01 v03r05
*FCC TCB Workshop 2012, April

3.2 Frequency Hopping System Requirements

3.2.1 Standard Applicable

According to FCC Part 15.247(a)(1), The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

(g) Frequency hopping spread spectrum systems are not required to employ all available hopping channels during each transmission. However, the system, consisting of both the transmitter and the receiver, must be designed to comply with all of the regulations in this section should the transmitter be presented with a continuous data (or information) stream. In addition, a system employing short transmission bursts must comply with the definition of a frequency hopping system and must distribute its transmissions over the minimum number of hopping channels specified in this section.

(h) The incorporation of intelligence within a frequency hopping spread spectrum system that permits the system to recognize other users within the spectrum band so that it individually and independently chooses and adapts its hopsets to avoid hopping on occupied channels is permitted. The coordination of frequency hopping systems in any other manner for the express purpose of avoiding the simultaneous occupancy of individual hopping frequencies by multiple transmitters is not permitted.

3.3 TECHNICAL CHARACTERISTIC TEST

3.3.1 Carrier Frequency Separation

Procedure:

The test follows ANSI C63.10. The carrier frequency separation was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

After the trace being stable, the reading value between the peaks of the adjacent channels using the marker-delta function was recorded as the measurement results.

The spectrum analyzer is set to:

Span = 2~ 3 MHz (wide enough to capture the peaks of two adjacent channels)

RBW = 100 kHz (1% of the span or more)   Sweep = auto

VBW = 100 kHz   Detector function = peak

Trace = max hold

Measurement Data:

Test Results	
Carrier Frequency Separation (MHz)	**Result**
2.001 (BDR)_Tx1	Complies
2.001 (BDR)_Tx2	
1.997 (EDR)_Tx1	
2.001 (EDR)_Tx2	

- See next pages for actual measured spectrum plots.

Minimum Standard:

The EUT shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or two-thirds of 20 dB bandwidth of the hopping channel, whichever is greater.
Measurement Setup

Figure 1: Measurement setup for the carrier frequency separation

Carrier Frequency Separation

BDR Mode(Tx1 / Tx2)

EDR Mode(Tx1 / Tx2)

3.3.2 Number of Hopping Frequencies

Procedure:

The test follows ANSI C63.10. The number of hopping frequencies was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

To get higher resolution, four frequency ranges within the 2400 ~ 2483.5 MHz FH band were examined.

The spectrum analyzer is set to (Bluetooth):

Frequency range　　Start = 2400.0 MHz,　Stop = 2483.5 MHz

RBW = 100 kHz (1% of the span or more)　　Sweep = auto

VBW = 100 kHz (VBW $\geq$ RBW)　　Detector function = peak

Trace = max hold　　Span > 40 MHz

Measurement Data :　**Complies**

| Total number of Hopping Channels	79 (Basic, EDR)

- See next pages for actual measured spectrum plots.

Minimum Standard:

At least 15 channels

Measurement Setup

Same as the Chapter 3.3.1 (Figure 1)

Number of Hopping Frequencies (BDR, EDR)

3.3.3 20 dB Bandwidth

Procedure:

The bandwidth at 20 dB below the highest inband spectral density was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission.   Use the marker-delta function to measure 20 dB down one side of the emission.   Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the 20 dB bandwidth of the emission.

The spectrum analyzer is set to (Bluetooth):

Center frequency = the highest, middle and the lowest channels

Span = 3 MHz (approximately 2 or 3 times of the 20 dB bandwidth)

RBW = 30 kHz   Sweep = auto

VBW = 30 kHz (VBW $\geq$ RBW)   Detector function = peak

Trace = max hold

Measurement Data:

BDR Mode_Tx1

Frequency (MHz)	Channel No.	Test Results(MHz)	
		20dB Bandwidth	99% Bandwidth
2402	0	0.986	0.881
2441	39	0.981	0.881

3.3.4 Time of Occupancy (Dwell Time)

Procedure:

The test follows ANSI C63.10. The dwell time was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function enabled.

The spectrum analyzer is set to :

Center frequency = 2441 MHz   Span = zero

RBW = 1 MHz   VBW = 1 MHz (VBW $\geq$ RBW)

Trace = max hold   Detector function = peak

Measurement Data (Basic,EDR):

Mode	Number of transmission in a 31.6s (79Hopping*0.4)	Length of Transmission Time (msec)	Result (msec)	Limit (msec)
DH5_Tx1	8(Times / 3sec) *10.533 = 84.264	2.870	241.838	
DH5_Tx2	6(Times / 3sec) *10.533 = 157.995	2.855	180.430	400
3-DH5_Tx1	6(Times / 3sec) *10.533 = 157.995	1.073	67.811	
3-DH5_Tx2	3(Times / 3sec) *10.533 = 73.731	1.065	33.653	

- See next pages for actual measured spectrum plots.
- dwell time = {(number of hopping per second / number of slot) x duration time per channel} x 0.4 ms
Minimum Standard:

0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed
Measurement Setup

Same as the Chapter 3.3.1 (Figure 1)

DH5 at BDR mode

3-DH5 at EDR mode

3.3.5 Transmitter Output Power

Procedure:

The test follows ANSI C63.10. The peak output power was measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the peak output power.

The spectrum analyzer is set to :

Center frequency = the highest, middle and the lowest channels

Span = 10 MHz (approximately 5 times of the 20 dB bandwidth)

RBW = 3 MHz (greater than the 20 dB bandwidth of the emission being measured)

VBW = 3 MHz (VBW $\geq$ RBW)   Detector function = peak

Trace = max hold   Sweep = auto

Measurement Data :

BDR Mode_Tx1

Frequency (MHz)	Ch.	Test Results		
		dBm	mW	Result
2402	1	**9.41**	**8.73**	Complies
2441	40	**9.52**	**8.95**	Complies

3.3.6 Band Edge

Procedure:

The bandwidth at 20 dB down from the highest inband spectral density is measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels.

After the trace being stable, Use the marker-to-peak function to measure 20 dB down both sides of the intentional emission.

The spectrum analyzer is set to:

Center frequency = the highest, middle and the lowest channels

RBW = 100 kHz   VBW = 100 kHz

Span = 10~30 MHz   Detector function = peak

Trace = max hold   Sweep = auto

Measurement Data: Complies

- All conducted emission in any 100 kHz bandwidth outside of the spread spectrum band was at least 20 dB lower than the highest inband spectral density.   Therefore the applying equipment meets the requirement.

- See next pages for actual measured spectrum plots.

Minimum Standard:	> 20 dBc

Measurement Setup

Same as the Chapter 3.3.1 (Figure 1)

BDR(Tx1/ Tx2)
EDR(Tx1/ Tx2)
Note : This EUT was tested in 3 orthogonal positions and the worst-case data was presented.

3.3.7 Conducted Spurious Emissions

Procedure:

The test follows ANSI C63.10. The conducted spurious emissions were measured with a spectrum analyzer connected to the antenna terminal, while EUT had its hopping function disabled at the highest, middle and the lowest available channels..

After the trace being stable, set the marker on the peak of any spurious emission recorded.

The spectrum analyzer is set to:

Span = wide enough to capture the peak level of the in-band emission and all spurious emissions

|	
RBW = 100 kHz	Sweep = auto
VBW = 100 kHz	Detector function = peak
Trace = max hold	

Measurement Data: **Complies**

- All conducted emission in any 100 kHz bandwidth outside of the spread spectrum band was at least 20 dB lower than the highest inband spectral density.   Therefore the applying equipment meets the requirement.
- See next pages for actual measured spectrum plots.

| **Minimum Standard:**	> 20 dBc

Frequency Range = 30 MHz ~ 26.5 GHz

Tx1
Tx2
3.3.8 Radiated Spurious Emissions

Procedure:

Radiated emissions from the EUT were measured according to the dictates of ANSI C63.10. The EUT was placed on a 0.8 m high wooden table inside a shielded enclosure.   An antenna was placed near the EUT and measurements of frequencies and amplitudes of field strengths were recorded for reference during final measurements.   For final radiated testing, measurements were performed in OATS.   Measurements were performed with the EUT oriented in 3 orthogonal axis and rotated 360 degrees to determine worst-case orientation for maximum emissions.

(a) In the frequency range of 9 kHz to 30 MHz, magnetic field is measured with Loop Test Antenna. The Test Antenna is positioned with its plane vertical at 3 m distance from the EUT. The center of the Loop Test Antenna is 1m above the ground. During the measurement the Loop Test Antenna rotates about its vertical axis for maximum response at each azimuth about the EUT.

(b) In the frequency range above 30 MHz, Bi-Log Test Antenna (30 MHz to 1 GHz) and Horn Test Antenna (above 1 GHz) are used. Test Antenna is 3 m away from the EUT. Test Antenna height is carried from 1 m to 4m above the ground to determine the maximum value of the field strength. The emission levels at both horizontal and vertical polarizations should be tested.

The spectrum analyzer is set to:

Center frequency = the worst channel

Frequency Range = 9 kHz ~ 10th harmonic.

RBW = 120 kHz (30 MHz ~ 1 GHz)   VBW $\geq$ RBW

       = 1 MHz   (1 GHz ~ 10th harmonic)

Span = 100 MHz   Detector function = peak

Trace = max hold   Sweep = auto

below 30 MHz
below 1 GHz (30 MHz to 1 GHz)
above 1 GHz
Measurement Data: Complies

-    See next pages for actual measured data.

-    No other emissions were detected at a level greater than 20 dB below limit include from 9 kHz to 30 MHz.

-    The test results for the worst of the various operating modes are presented in accordance with 6.3.4 of ANSI C63.10.

-    Checked with a red circle is the fundamental frequency.

Minimum Standard: FCC Part 15.209(a)

Frequency (MHz)	Limit (uV/m) @ 3m
0.009 ~ 0.490	2400/F(kHz) (@ **300m**)
0.490 ~ 1.705	24000/F(kHz) (@ **30m**)
1.705 ~ 30	30(@ **30m**)

3.3.9 AC Conducted Emissions

Procedure:

AC power line conducted emissions from the EUT were measured according to the dictates of ANSI C63.4:2003.

The conducted emissions are measured in the shielded room with a spectrum analyzer in peak hold.   While the measurement, EUT had its hopping function disabled at the middle channels in line with Section 15.31(m). Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz.   The emissions are maximized further by cable manipulation and Exerciser operation.   The highest emissions relative to the limit are listed.

Measurement Data: N/A

Minimum Standard: FCC Part 15.207(a)/EN 55022

Frequency Range	Quasi-Peak	Average
0.15 ~ 0.5	66 to 56 *	56 to 46 *
0.5 ~ 5	56	46
5 ~ 30	60	50

* Note: This product operates only with battery and does not operate during charging.

APPENDIX

TEST EQUIPMENT USED FOR TESTS

	Use	Description	Model No.	Serial No.	Manufacturer	Interval	Next Cal. Date
1	■	Signal Analyzer (9 kHz ~ 30 GHz)	FSV30	100757	R&S	1 year	2022-09-06
2	■	Signal Generator (~3.2 GHz)	8648C	3623A02597	HP	1 year	2022-03-16
3		SYNTHESIZED CW GENERATOR	83711B	US34490456	HP	1 year	2022-03-16
4		Attenuator (3 dB)	8491A	37822	HP	1 year	2022-09-06
