PROJECT OVERVIEW:

BCM94309MP is WLAN MiniPCI Multiband card incorporating 2.4GHz and 5GHz radios. This test report carries all measurements required as per FCC 15.407 on WLAN mini PCI card tested in laptop model PP09L in freq. band 5180-5320MHz **with Hitachi stamped metal sheet ant. max gain 2.8dBi**

WLAN was tested for spurious emissions in different data rates (1, 2, 5.5, 6, 11, and 54) to ensure compliance of the whole device. Test report shows only worst-case test results of all data rates.

26dB bandwidth

(Data rate – 6Mbps)

6Mbps is found to be worst-case for this measurement. Following method as defined in DA 02-2138 was used for this measurement.

Test Procedure:

- Use a RBW = approximately 1% of the emission bandwidth.
- Set the VBW > RBW
- Use a peak detector
- Do not use the max hold function. Rather, use the view button to capture the emission.
- Measure the maximum width of the emission that is 26dB down from the peak of the emission. Compare this with the RBW setting of the analyzer. Readjust RBW and repeat measurement as needed until the RBW/EBW ratio is approximately 1%.

PEAK POWER SPECTRAL DENSITY

§15.407 (a)(1)(2)(5)

(Data rate – 6Mbps)

6Mbps is found to be worst-case data rate for Power spectral density. Method-2 from DA 02-2138 was used for this measurement.

Test Procedure (Method-2):

Use sample detector and power averaging (not video averaging) mode. Set RBW=1MHz, VBW>1MHz. The PPSD is the highest level found across the emission in any 1-MHz band after 100 sweeps of averaging. This method is permitted only if the transmission pulse or sequence of pulses remains at maximum transmit power throughout each of the 100 sweeps of averaging and that the interval between pulses is not included in any of the sweeps. (e.g.; 100 sweeps occur during one transmission, or each sweep gated to occur during a transmission)

PEAK EXCURSION **§15.407 (a)(6)**
(Data rate – 54Mbps)

54Mbps is found to be worst-case for this measurement. Following method as defined in DA 02-2138 was used for this measurement.

Test Procedure:

Set the spectrum analyzer span to view the entire emission bandwidth. The largest difference between the following two traces must be ≤ 13dB for all frequencies across the emission bandwidth. Submit a plot.

1st Trace:

- Set RBW=1MHz, VBW≥3MHz with peak detector and max hold settings

2nd Trace:

- If method #1 was used for the peak conducted transmit output power test, then create the 2nd trace using the settings described in method #1.
- If method #2 or #3 were used for the peak conducted transmit power test, then create the 2nd trace using the settings described in method #3.

Since method #3 is applicable for measuring peak output power for EUT following analyzer settings were used;

1st Trace: RBW = 1MHz, VBW = 3MHz

2nd Trace: RBW = 1MHz, VBW = 5KHz

NOTE:

1. The radiated emissions were done with different settings, using the relevant pre-amplifiers for the relevant frequency ranges. This is the reason that the graphs show different noise levels. In the range between 3 and 40 GHz very short cable connections to the antenna was used to minimize the noise level.

2. All measurements are done in peak mode unless specified with the plots.

0.009 - 0.490	2400/F (kHz)	300
0.490 - 1.705	24000/F (kHz)	30
1.705 - 30.0	30	30

88 - 216	150	3
216 - 960	200	3
above 960	500	3

NOTE:

The radiated emissions were done with different settings, using the relevant pre-amplifiers for the relevant frequency ranges. This is the reason that the graphs show different noise levels. In the range between 3 and 26.5 GHz very short cable connections to the antenna was used to minimize the noise level.
