# 8. LIQUID PARAMETERS CHECK

The simulating liquids should be checked at the beginning of a series of SAR measurements to determine of the dielectric parameters are within the tolerances of the specified target values. The relative permittivity and conductivity of the tissue material should be within ± 5% of the values given in the table below.

**Reference Values of Tissue Dielectric Parameters for Head and Body Phantom (for 150 – 3000 MHz and 5800 MHz)**

The head tissue dielectric parameters recommended by the IEEE SCC-34/SC-2 in IEEE Standard 1528 have been incorporated in the following table. These head parameters are derived from planar layer models simulating the highest expected SAR for the dielectric properties and tissue thickness variations in a human head. Other head and body tissue parameters that have not been specified in P1528 are derived from the tissue dielectric parameters computed from the 4-Cole-Cole equations and extrapolated according to the head parameters specified in IEEE Standard 1528.

# 9. SYSTEM PERFORMANCE

The system performance check is performed prior to any usage of the system in order to guarantee reproducible results. The system performance check verifies that the system operates within its specifications of ±10%.

**System Performance Check Measurement Conditions**

- The measurements were performed in the flat section of the SAM twin phantom filled with Body simulating liquid of the following parameters.
- The DASY4 system with an Isotropic E-Field Probe EX3DV4-SN: 3686 was used for the measurements.
- The dipole was mounted on the small tripod so that the dipole feed point was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10 mm (above 1 GHz) and 15 mm (below 1 GHz) from dipole center to the simulating liquid surface.
- The coarse grid with a grid spacing of 15 mm was aligned with the dipole.
  For 5 GHz band - The coarse grid with a grid spacing of 10 mm was aligned with the dipole.
- Special 7x7x7 (2.4 GHz) fine cube was chosen for cube integration and Special 8x8x10 (5 GHz) fine cube was chosen for cube integration
- Distance between probe sensors and phantom surface was set to 4 mm.
  For 5 GHz band - Distance between probe sensors and phantom surface was set to 2.5mm
- The dipole input power (forward power) was 250 mW±3%.
- The results are normalized to 1 W input power.

# 10. OUTPUT POWER VERIFICATION

The following procedures had been used to prepare the EUT for the SAR test.
The client provided a special driver and program, wl_tools, which enable a user to control the frequency and output power of the module.

**RF Conducted Output Power Measurement Results:**

**Please refer to Broadcom's Operational Description document for Average Power information ( confidential exhibit) as documented in 11/30/2007 original filing.**

**Before SAR evaluation, CCS has verified the RF conducted average power at 2437 MHz which is in a agreement with previous reported average output power.**

# 11. SUMMARY OF TEST RESULTS

## 11.1. SAR TEST RESULT FOR THE BAND 2400 – 2483.5 MHZ

### 11.1.1. LAPHELD POSITION

| Mode | Channel | f (MHz) | Antenna | Measured SAR 1g (mW/g) | Limit (mW/g) |
|---|---|---|---|---|---|
| 802.11b | 1 | 2412 | | | 1.6 |
| | 6 | 2437 | Main | 0.000246 | |
| | 11 | 2462 | | | |
| 802.11g | 1 | 2412 | | | 1.6 |
| | 6 | 2437 | Aux | 0.004080 | |
| | 11 | 2462 | | | |

Notes:

1. 802.11b doesn't operate for Aux antenna. Thus, 802.11g is performed for Aux antenna instead.
2. The modes with highest output power channel were chosen for the testing.
3. Test configuration: Lapheld with display open at 90° to the keyboard.
4. The SAR measured at the middle channel for this configuration is at least 3 dB lower (0.8 mW/g) than SAR limit (1.6 mW/g), thus testing at low & high channel is optional.

# 12. Enhanced Energy Coupling (KDB 447498)

According to KDB 447498, the test configuration with the highest 1-g SAR must be used to determine if additional SAR evaluation is required due to enhanced energy coupling at increased separation distances.

From the test results above, a single point SAR at 10 (mm) from the initial touching position is less than 50% of that measured at the initial position. Thus, additional SAR evaluation is not required.

| | SAR (mw/g) | E-field (V/m) | Lower than Initial (%) |
|---|---|---|---|
| Initial | 0.00408 | 1.802 | |
| 5 (mm) | 0.002562164 | 1.428 | 62.8% |
| 10 (mm) | 0.001395828 | 1.054 | 34.2% |
