## 1. TABLE FOR MULTIPLE LIST

### 1.1. Table for Multiple List

The EUT has two part numbers which are identical to each other in all aspects except for the following table:

| Model No. | Part No. | Description |
| :---: | :---: | :---: |
| BCM94356Z | BCM94356Z | The base pin between these two models is different. |
|  | BCM94356ZAE |  |

From the above models, part number: BCM94356Z was selected as representative model for the test and its data was recorded in this report.

## 2. MAXIMUM PERMISSIBLE EXPOSURE

## 2. 1. Applicable Standard

Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess limit for maximum permissible exposure. In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as a mobile device whereby a distance of 0.2 m normally can be maintained between the user and the device.

Note: $\mathrm{f}=$ frequency in MHz ; *Plane-wave equivalent power density

### 2.2. MPE Calculation Method

$E(\mathrm{~V} / \mathrm{m})=\frac{\sqrt{30 \times P \times G}}{d}$
Power Density: $\quad P d\left(W / \mathrm{m}^{2}\right)=\frac{E^{2}}{377}$
$\mathrm{E}=$ Electric field $(\mathrm{V} / \mathrm{m})$
P = Peak RF output power (W)
$\mathbf{G}=$ EUT Antenna numeric gain (numeric)
d = Separation distance between radiator and human body (m)
The formula can be changed to
$P d=\frac{30 \times P \times G}{377 \times d^{2}}$
From the EUT RF output power, the minimum mobile separation distance, $\mathrm{d}=0.2 \mathrm{~m}$, as well as the gain of the used antenna, the RF power density can be obtained.

### 2.3. Calculated Result and Limit

Exposure Environment: General Population / Uncontrolled Exposure For 5GHz UNII Band:

Antenna Type : WLAN/BT antenna
Conducted Power for IEEE 802.11ac VHT20: 21.73dBm

| Distance (m) | Directional Gain (dBi) | Antenna Gain (numeric) | The maximum combined Average Output Power |  | Power Density (S) ( $\mathrm{mW} / \mathrm{cm}^{2}$ ) | Limit of Power Density (S) ( $\mathrm{mW} / \mathrm{cm}^{2}$ ) | Test Result |

| 0.2 | 9.22 | 8.3560 | 21.7254 | 148.7798 | 0.247454 | 1 | Complies |
| Note: DirectionalGain $=10 \cdot 10 g\left[\frac{\sum_{j=1}^{N}\left\{\sum_{k=1}^{N} g \mu_{N}\right\}^{2}}{N_{\text {ANT }}}\right]=9.22 \mathrm{dBi}$ |  |  |  |  |  |  |  |

For 2.4GHz Band:

## Conclusion:

Both of the WLAN 5GHz Band + Bluetooth and WLAN 2.4GHz Band + Bluetooth can transmit simultaneously, the formula of calculatedthe MPE is:
CPD1 / LPD1 + CPD2 / LPD2 + ......etc. < 1
CPD = Calculation power density
LPD = Limit of power density
Therefore, the worst-case situation are $0.247454 / 1+0.006025 / 1=0.253479$ for WLAN 5GHz Band + Bluetooth and $0.097067 / 1+0.006025 / 1=0.103092$ for WLAN 2.4 GHz Band + Bluetooth, which are less than "1". This confirmed that the device comply with FCC 1.1310 MPE limit.
