4. Test Results of RF Exposure Evaluation

TEST: RF Exposure Evaluation		
Method	RF Exposure Evaluation of the EUT were measured according to the dictates in KDB 447498 Pd the limit of MPE, 1 mW/cm². If we know the maximum gain of the antenna and the total power input to the antenna, through the calculation, we will know the distance where the MPE limit is reached. Friis transmission formula: $P_d = (P_{out} * G) / (4 * \pi * R^2)$ Where P_d = power density in mW/cm² P_{out} = output power to antenna in mW G = gain of antenna in linear scale π = 3.1416 R = distance between observation point and center of the radiator in cm General SAR test exclusion guidance The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at <i>test separation distances</i> ≤ 50 mm are determined by: $[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [\sqrt{f_{\text{GHz}}}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where f_{GHz} is the RF channel transmit frequency in GHz Power and distance are rounded to the nearest mW and mm before calculation¹⁷ The result is rounded to one decimal place for comparison When the minimum <i>test separation distance</i> is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.
