PVS8 verification of output power and unwanted emissions

7 Layers as test laboratory has verified the influences of hardware changes which were made between the initial Cinterion module PVS8 and its updated version with added CDMA2000/EV-DO band BC10. Outcome of this verification is that the output power and the unwanted emissions of updated PVS8 module are within the allowed tolerances considering the measurement uncertainty and production tolerances. Hence the measurement results of the initial PXS8 FCC certification are also valid for the updated module PVS8.

Yours sincerely

i.A. René Houx
