### TEST PROCEDUREC

Connect the UUT to the spectrum analyser and use the following settings:

|                  |  |
|------------------|--|
| Center Frequency | The center frequency of the channel under test   |
| Detector         | Peak   |
| RBW              | For 6dB Bandwidth: RBW=100kHz<br>For 26dB Bandwidth: approximately 1% of the emission bandwidth.<br>For 99dB Bandwidth: approximately 1%~5% of the emission bandwidth. |
| VBW              | For 6dB Bandwidth : VBW=300kHz<br>For 26dB Bandwidth : >3RBW<br>For 99%dB Bandwidth : >3RBW  |
| Trace            | Max hold   |
| Sweep            | Auto couple  |

Allow the trace to stabilize and measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6/26/99% dB relative to the maximum level measured in the fundamental emission.

Note: 1. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6dBi. Directional gain =  $G_{ANT} + 10 \log(N_{ANT})$  dBi, where  $N_{ANT}$  is the number of outputs,  $G_{ANT}$  is the Antenna gain.

#### TEST PROCEDURE

Refer to KDB 789033 D02 General UNII Test Procedures New Rules v02r01

Connect the EUT to the a broadband gated RF average power meter, the power meter shall have a video bandwidth that is greater than or equal to the bandwidth and shall utilize a fast-responding diode detector.

#### 6.4. Maximum e.i.r.p. at any elevation angle above 30 degrees

In addition to the emission limits specified in Section 15.407(a)(1)(i), if the access point is an outdoor Point-to-Multipoint device operating in the band 5.15–5.25 GHz, the rules require that the maximum EIRP at Any condensation angle above 30° not exceed 125 mW (21 dBm) as measured from the horizon.

### TEST PROCEDURE

Connect the UUT to the spectrum analyser and use the following settings:

For U-NII-1, U-NII-2A and U-NII-2C band:

|                  |  |
|------------------|--|
| Center Frequency | The center frequency of the channel under test               |
| Detector         | RMS  |
| RBW              | 1MHz   |
| VBW              | $\geq 3 \times$ RBW  |
| Span             | Encompass the entire emissions bandwidth (EBW) of the signal |
| Trace            | Max hold   |
| Sweep time       | Auto   |

For U-NII-3:

|                  |  |
|------------------|--|
| Center Frequency | The center frequency of the channel under test |
| Detector         | RMS  |
| RBW              | 500KHz   |

|            |  |
|------------|--|
| VBW        | $\geq 3 \times \text{RBW}$                                   |
| Span       | Encompass the entire emissions bandwidth (EBW) of the signal |
| Trace      | Max hold   |
| Sweep time | Auto   |

Note:

1. For UNII-3, according to KDB publication 789033 General UNII Test Procedures New Rules v01, section II.F.5., it is acceptable to set RBW at 1MHz and VBW at 3MHz if the spectrum analyzer does not have 500kHz RBW.
2. The value measured with RBW=1MHz is to be added with  $10\log(500\text{kHz}/1\text{MHz})$  which is - 3dB. For example, if the measured value is +10dBm using RBW=1MHz (that is +10dBm/MHz), then the converted value will be +7dBm/500kHz.

Allow trace to fully stabilize and use the peak marker function to determine the maximum amplitude level within the RBW.

Add  $10 \log (1/x)$ , where x is the duty cycle, to the measured power in order to compute the average power during the actual transmission times
