## 1．2 Test Methodology of Applied Standards

FCC Part 15，Subpart C $\$ 15.247$
FCC KDB 558074 D01 DTS Meas．Guidance
ANSI C63．10：2013
Note：All test items have been performed and record as per the above standards．

## 1．3 Test Facility

SGS Taiwan Ltd．Electronics \＆Communication Laboratory No．2，Keji 1st Rd．， Guishan District，Taoyuan City，Taiwan 333 （TAF code 0513）

FCC Registration Numbers are： 735305

## 1．4 Special Accessories

There are no special accessories used while test was conducted．

## 1．5 Equipment Modifications

There was no modification incorporated into the EUT．

## 2．SYSTEM TEST CONFIGURATION

## 2．1 EUT Configuration

The EUT configuration for testing is installed on RF field strength measurement to meet the Commissions requirement and operating in a manner which intends to maximize its emission characteristics in a continuous normal application．

## 2．2 EUT Exercise

An engineering test mode（software／firmware）that applicant provided was utilized to manipulate the EUT into transmit，selection of the test channel，and modulation scheme．

## 2．3 Test Procedure

## 2．3．1 Conducted Emissions

The EUT is a placed on as turn table which is 0.8 m above ground plan．Conduct－ ed emissions from the EUT measured in the frequency range between 0.15 MHz and 30 MHz ，．The CISPR Quasi－Peak and Average detector mode is employed according to $\S 15.207$ ．The two LISNs provide $50 \mathrm{ohm} / 50 \mathrm{uH}$ of coupling imped－ ance for the measuring instrument．Both lines of the power mains connected to the EUT were checked for maximum conducted interference．

## 2．3．2 Radiated Emissions

The EUT is a placed on as turn table．For emissions testing at or below 1 GHz ，the table height shall be 0.8 m above the reference ground plan．For emission meas－ urements above 1 GHz ，the table height shall be 1.5 m ．The turn table shall rotate 360 degrees to determine the position of maximum emission level．EUT is set 3 m away from the receiving antenna which varied from 1 m to 4 m to find out the high－ est emission．And also，each emission was to be maximized by changing the po－ larization of receiving antenna both horizontal and vertical．In order to find out the max．emission，the relative positions of this hand－held transmitter（EUT）was ro－ tated through three orthogonal axes and measurement procedures for electric field radiated emissions above 1 GHz the EUT measurement is to be made＂while keeping the antenna in the＇cone of radiation＇from that area and pointed at the area both in azimuth and elevation，with polarization oriented for maximum re－ sponse．＂is still within the 3dB illumination BW of the measurement antenna．

## 2．4 Measurement Results Explanation Example

## For all conducted test items：

The offset level is set in the spectrum analyzer to compensate the RF cable loss and attenuation factor between EUT conducted port and spectrum analyzer．With the offset compensation，the spectrum analyzer reading level is exactly EUT RF output level．

## Note：

The spectrum analyzer offset is derived from RF cable loss 1 dB ．

## 6．3 EUT Setup：

1．The conducted emission tests were performed in the test site，using the setup in accordance with the ANSI C63．10：2013．

2．The AC／DC Power adaptor of EUT was plug－in LISN．The EUT was placed flushed with the rear of the table．

3．The LISN was connected with $120 \mathrm{Vac} / 60 \mathrm{~Hz}$ power source．

Report No．：E2／2017／80089

## 6．4 Test SET－UP（Block Diagram of Configuration）

## 6．5 Measurement Procedure：

1．The EUT was placed on a table which is 0.8 m above ground plan．
2．Maximum procedure was performed on the six highest emissions to ensure EUT compliance
3．Repeat above procedures until all phases of power being supplied by given UE are completed

## 7．PEAK OUTPUT POWER MEASUREMENT

## 7．1 Standard Applicable：

For systems using digital modulation in the $2400-2483.5 \mathrm{MHz}$ bands，the limit for peak output power is 1 Watt ．

If the transmitting antenna of directional gain greater than 6 dBi are used the peak output power form the intentional radiator shall be reduced below the above stated value by the amount in dB that the directional gain of the Antenna exceeds 6 dBi ．
In case of point－to－point operation，the limit has to be reduced by 1 dB for every 3 dB that the direc－ tional gain of Antenna exceeds 6 dBi ．

## 9．CONDUCTED BAND EDGES AND SPURIOUS EMISSION MEASUREMENT

## 9．1 Standard Applicable

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating，the radio frequency power that is produced by the inten－ tional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that con－ tains the highest level of the desired power，based on either an RF conducted or a radiated meas－ urement，provided the transmitter demonstrates compliance with the peak conducted power limits．In addition，radiated emissions which fall in the restricted bands，as defined in §15．205（a），must also comply with the radiated emission limits specified in $\S 15.209(a)$ ．

## 9．3 Test SET－UP：

## 9．4 Measurement Procedure

## Conducted Band Edge：

1．To connect Antenna Port of EUT to Spectrum．
2．The testing follows the Measurement Procedure of FCC KDB 558074 D01 DTS Meas． Guidance．
3．Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to the spectrum analyzer．
4．Set start to edge frequency，and stop frequency of spectrum analyzer so as to encompass the spectrum to be examined．
5．Set the spectrum analyzer as RBW＝100 kHz，VBW＝300 kHz，Detector $=$ Peak，Sweep $=$ auto
6．Mark the highest reading of the emission as the reference level measurement．
7．Set DL as the limit $=$ reading on marker $1-20 \mathrm{dBm}$
8．Marker on frequency， 2.3999 GHz and 2.4836 GHz ，and examine shall 100 kHz immediately outside the authorized（2400～2483．5）be attenuated by 20 dB at least relative to the maxi－ mum emission of power．
9．Repeat above procedures until all default test channel（low，middle，and high）was com－ plete．

## Conducted Spurious Emission：

1．To connect Antenna Port of EUT to Spectrum．
2．The testing follows the Measurement Procedure of FCC KDB 558074 D01 DTS Meas． Guidance．
3．Set RBW $=100 \mathrm{kHz}$ \＆VBW＝300 kHz，Detector $=$ Peak，Sweep $=$ Auto
4．Allow trace to fully stabilize．
5．Use the peak marker function to determine the maximum power level in any 100 kHz band segment within the fundamental EBW．
6．Repeat above procedures until all default test channel measured were complete．

## 9．5 Measurement Result

1．Refer to next page spectrum analyzer data chart and tabular data sheets．
2．For restricted Band Edge Limit，please refer to section 12.5 of this report for measurement result．

## 10．RADIATED BANDEDGE AND SPURIOUS EMISSION MEASUREMENT

## 10．1 Standard Applicable

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating，the radio frequency power that is produced by the inten－ tional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power，based on either an RF conducted or a radiated measurement，provided the transmitter demonstrates compliance with the peak conducted power limits．In addition，radiated emissions which fall in the restricted bands must also comply with the §15．209 limit as below．
And according to $\S 15.33(\mathrm{a})(1)$ ，for an intentional radiator operates below 10 GHz ，the frequency range of measurements：to the tenth harmonic of the highest fundamental frequency or to 40 GHz ， whichever is lower．

| Frequency <br> $(\mathrm{MHz})$ | Field strength <br> （microvolts／meter） | Distance <br> （meters） |
| :---: | :---: | :---: |

## 10．4 Measurement Procedure

1．The testing follows the Measurement Procedure of FCC KDB 558074 D01 DTS Meas． Guidance．
2．The EUT was placed on a turn table with 0.8 m for frequency $<1 \mathrm{GHz}$ and 1.5 m for frequen－ cy＞ 1 GHz above ground plan．
3．The turn table shall rotate 360 degrees to determine the position of maximum emission level．
4．EUT is set 3 m away from the receiving antenna which varied from 1 m to 4 m to find out the highest emissions．
5．Set the spectrum analyzer as RBW＝120 kHz and VBW＝300 kHz for Peak Detector（PK） and Quasi－peak（QP）at frequency below 1 GHz ．
6．Set the spectrum analyzer as RBW＝1 MHz，VBW＝3 MHz for Peak Detector at frequency above 1 GHz ．
7．Set the spectrum analyzer as RBW $=1 \mathrm{MHz}, \mathrm{VBW}=10 \mathrm{~Hz}$（Duty cycle $>98 \%$ ）or VBW $\geq 1 / \mathrm{T}$ （Duty cycle＜98\％）for Average Detector at frequency above 1 GHz ．
8．When measurement procedures for electric field radiated emissions above 1 GHz the EUT measurement is to be made＂while keeping the antenna in the＇cone of radiation＇from that area and pointed at the area both in azimuth and elevation，with polarization oriented for maximum response．＂is still within the 3dB illumination BW of the measurement antenna．
9．Maximum procedure was performed on the six highest emissions to ensure EUT compli－ ance．
10．And also，each emission was to be maximized by changing the polarization of receiving an－ tenna both horizontal and vertical．On spectrum，change spectrum mode in linear display mode，and reduce VBW $=10 \mathrm{~Hz}$ if average reading is measured．
11．Repeat above procedures until all default test channel measured were complete．

## 10．5 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor and subtracting the Amplifier Gain and Duty Cycle Correction Factor（if any）from the measured reading．The basic equation with a sample calculation is as follows：

$$
F S=R A+A F+C L-A G
$$

| Where $\quad$ FS $=$ Field Strength | CL＝Cable Attenuation Factor（Cable <br> Loss） |
| :---: | :--- |
| RA $=$ Reading Amplitude | AG＝Amplifier Gain |
| AF＝Antenna Factor |  |

Actual FS（ $\mathrm{dB} \mu \mathrm{V} / \mathrm{m}$ ）$=$ SPA．Reading level $(\mathrm{dB} \mu \mathrm{V})+$ Factor（ dB ）
Factor $(\mathrm{dB})=$ Antenna Factor（ $\mathrm{dB} \mu \mathrm{V} / \mathrm{m}$ ）＋Cable Loss（dB）－Pre＿Amplifier Gain（dB）

## 10．6 Test Results of Radiated Spurious Emissions form $9 \mathbf{k H z}$ to $\mathbf{3 0} \mathbf{~ M H z}$

The low frequency，which started from 9 kHz to 30 MHz ，was pre－scanned and the result which was 20 dB lower than the limit per 15．31（o）was not reported．

## 11．PEAK POWER SPECTRAL DENSITY

## 11．1 Standard Applicable：

The power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission．

## 11．2 Measurement Equipment Used：

## 11．3 Test Set－up：

## 11．4 Measurement Procedure：

1．Set analyzer center frequency to DTS channel center frequency．
2．The testing follows the Measurement Procedure of FCC KDB 558074 D01 DTS Meas． Guidance ．
3．Set the span to 1.5 times the DTS channel bandwidth．
4．Set the RBW $=3 \mathrm{kHz}$ \＆VBW $=10 \mathrm{kHz}$ ．
5．For defining Restricted Band Edge Limit： Set the RBW $=100 \mathrm{kHz}$ \＆VBW $=300 \mathrm{kHz}$ ．
6． Detector＝peak．
7．Sweep time＝auto couple．
8．Trace mode＝max hold．
9．Allow trace to fully stabilize．
10．Use the peak marker function to determine the maximum amplitude level．

## 12．ANTENNA REQUIREMENT

## 12．1 Standard Applicable：

For intentional device，according to $\S 15.203$ ，an intentional radiator shall be designed to ensure that no antenna other than furnished by the responsible party shall be used with the device．

If the transmitting antenna is greater than 6dBi，the power shall be reduced by the same level in dB comparing to gain minus 6dBi．

In case of point－to－point operation，the power shall be reduced by the one dB for every 3 dB that the directional gain of antenna exceeds 6 dBi ．

## 12．2 Antenna Connected Construction：

An embedded－in antenna design is used．
The antenna is designed as permanently attached and no consideration of replacement．Please see EUT photo and antenna spec．for details．
The antenna gain is less than 6 dBi ．Therefore，it is not necessary to reduce maximum output pow－ er limit．
