7.1.29 Conducted power measurements of Downlink LTE CA

In this section, the following conducted power measurement results of downlink LTE carrier aggregation are provided to quantify downlink only carrier aggregation SAR test exclusion per KDB 941225 D05A v01r01.

Uplink maximum output power is measured with downlink carrier aggregation active, using the channel with highest measured maximum output power when downlink carrier aggregation is inactive, to confirm that when downlink carrier aggregation is active uplink maximum output power remains within the specified tune-up tolerance limits and not more than ¼ dB higher than the maximum output power measured when downlink carrier aggregation inactive.

Power test equipment: a R&S Radio Communication Tester CMW500 was used.

7.1.30 Conducted power measurements of Proximity sensor triggering

In this section, the following procedure is used to determine the triggering distances, coverage and tilt angle influences per FCC KDB 616217 D04v01§6.

1) Procedures for determining proximity sensor triggering distances

As the IR proximity sensor locates on the front face of the device and detects objects approaching only from the **front side**, so triggering distance only need to be checked for the front side when device is under voice mode(WiFi VOIP or 2G&3G&4G sub antenna voice + WiFi simultaneous transmission).

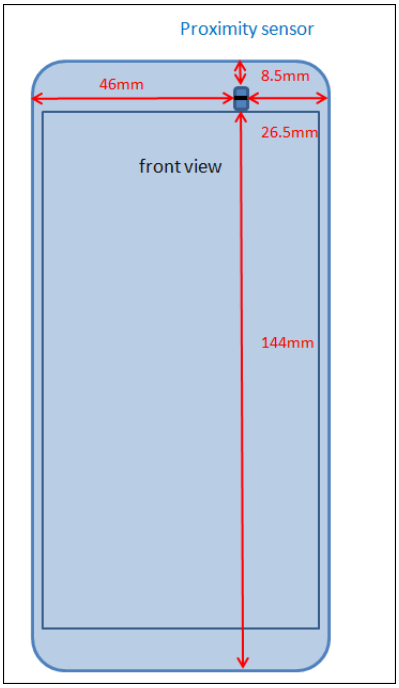

Figure 1: The location of the IR proximity sensor

FCC KDB 616217 D04v01§6.2, the proximity sensor triggering distance measurement results are as below:

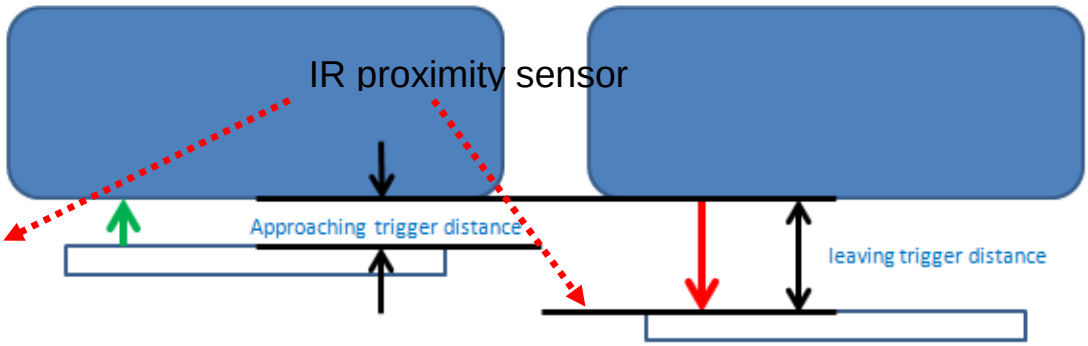

Figure 2: Proximity sensor triggering distances assessment (Front side only)

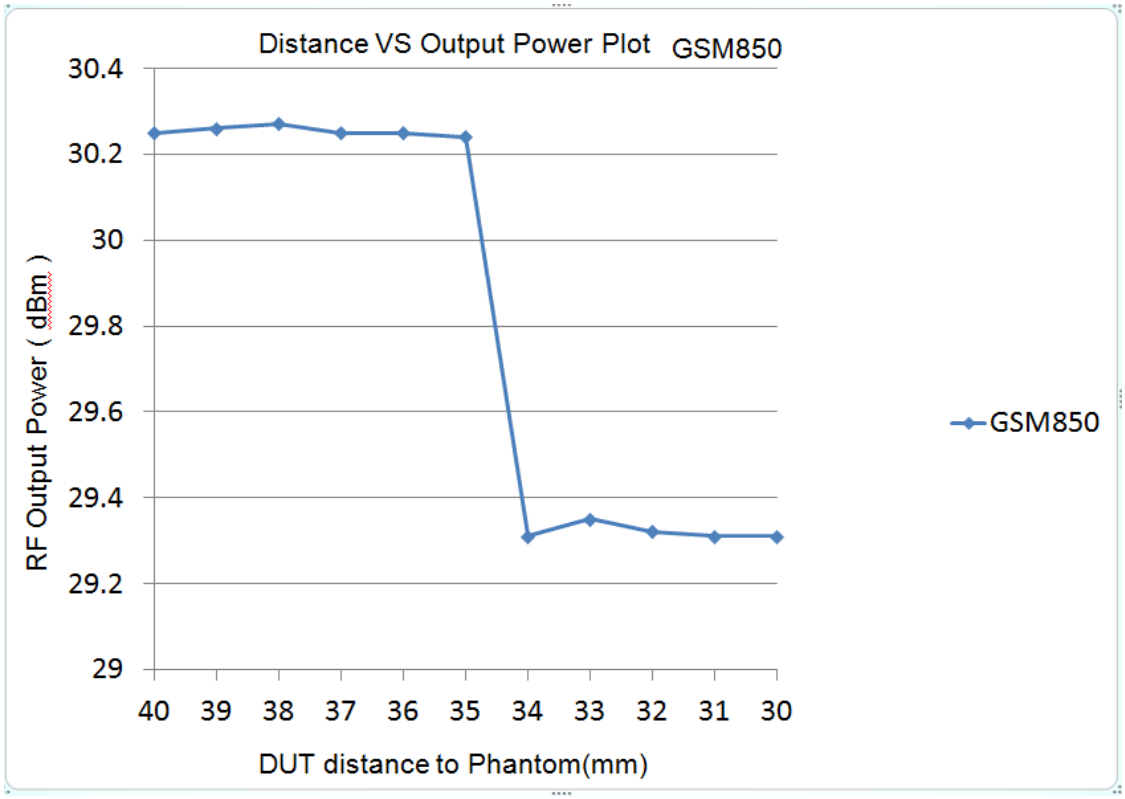
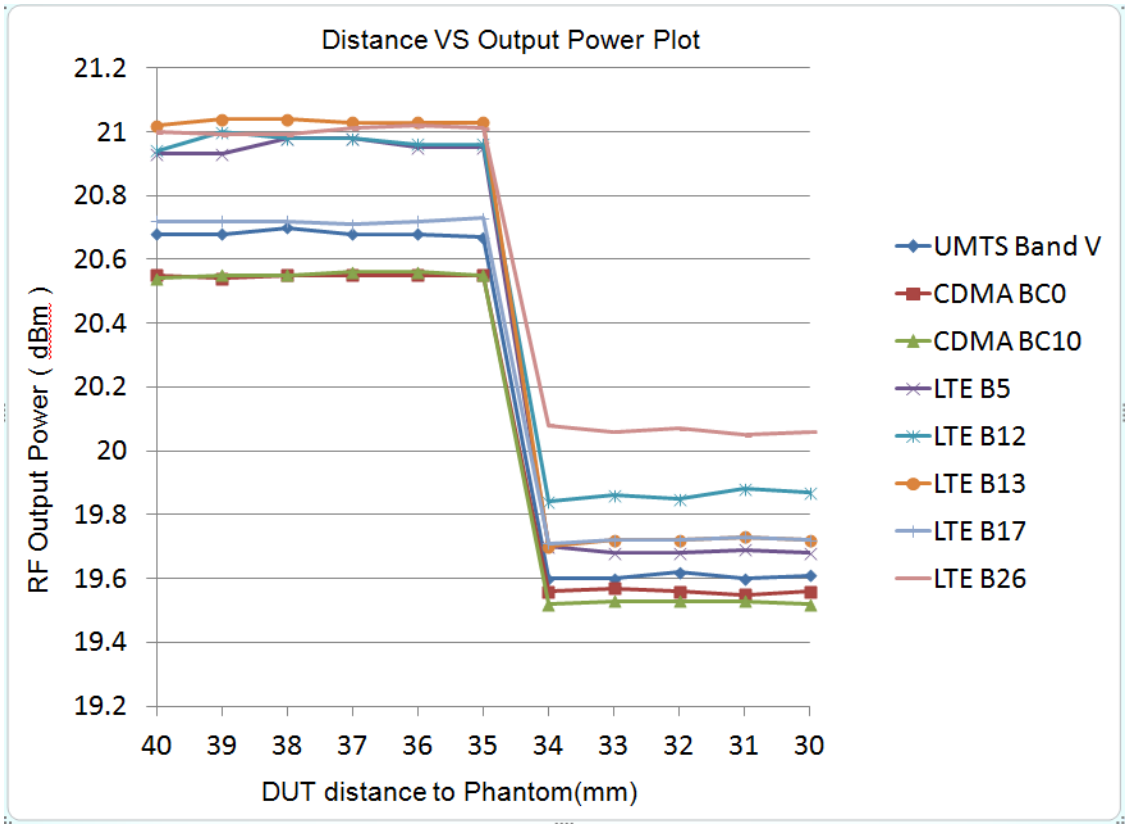
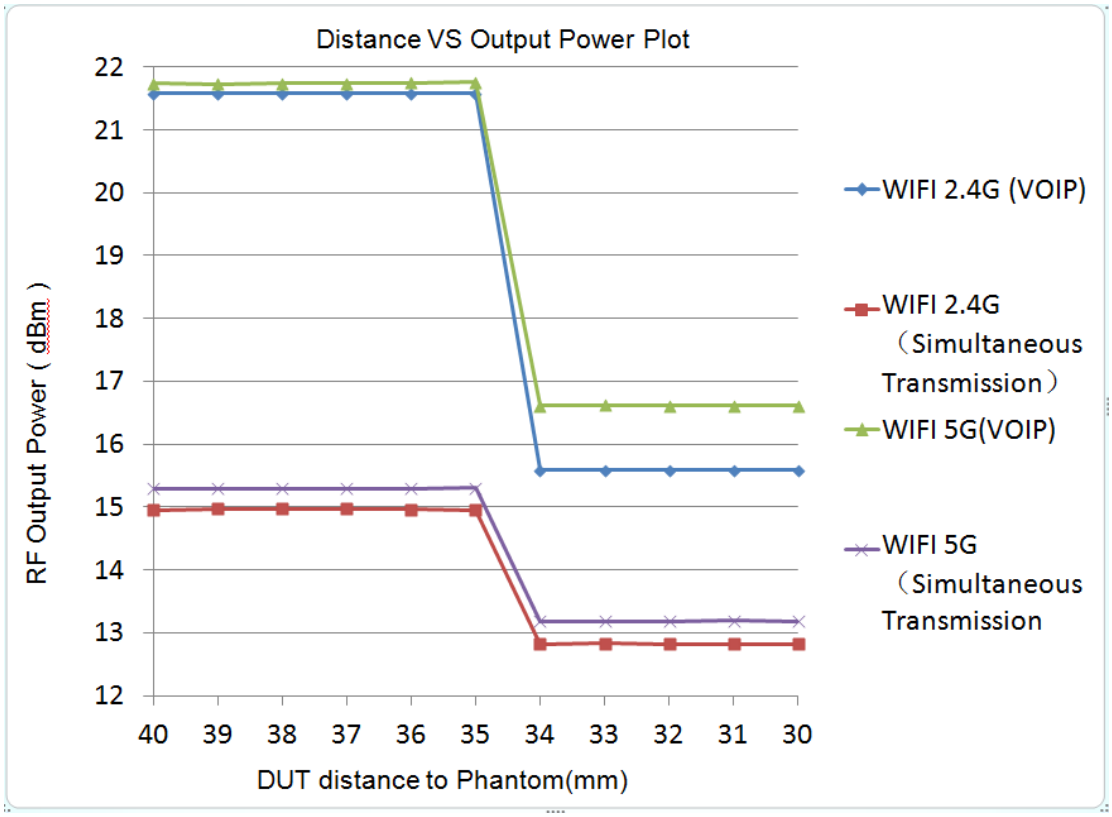
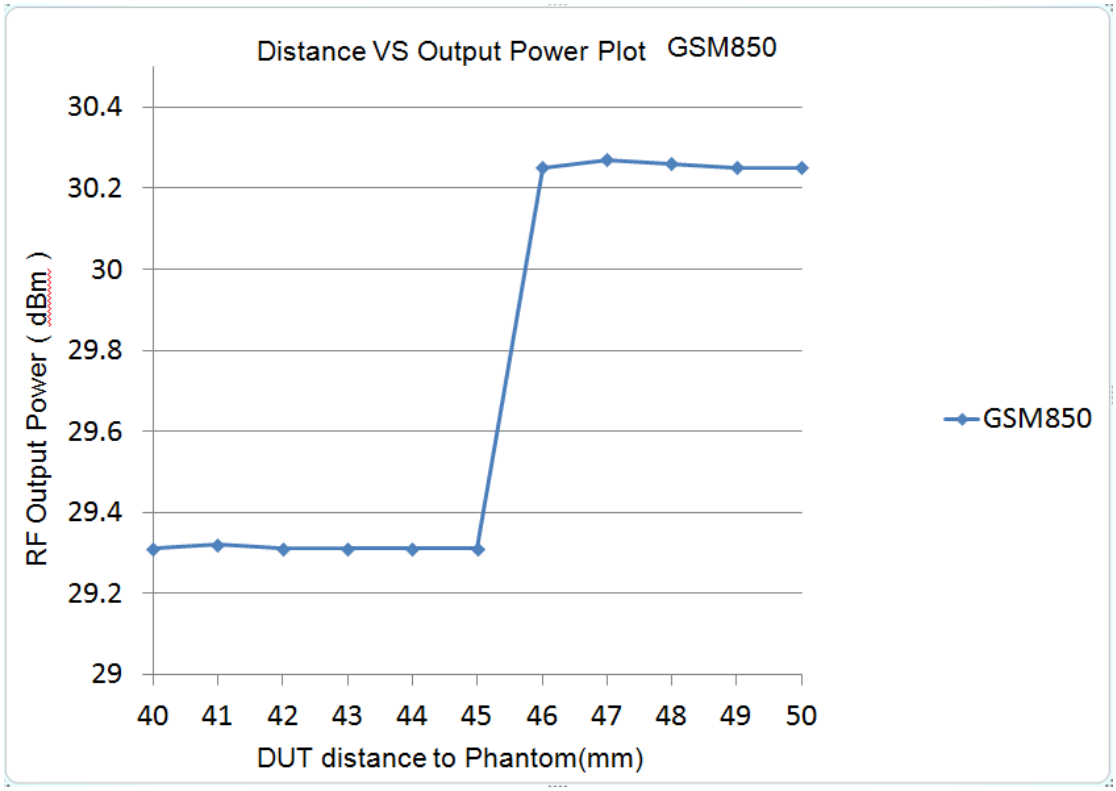
The DUT is moved towards from the flat phantom:

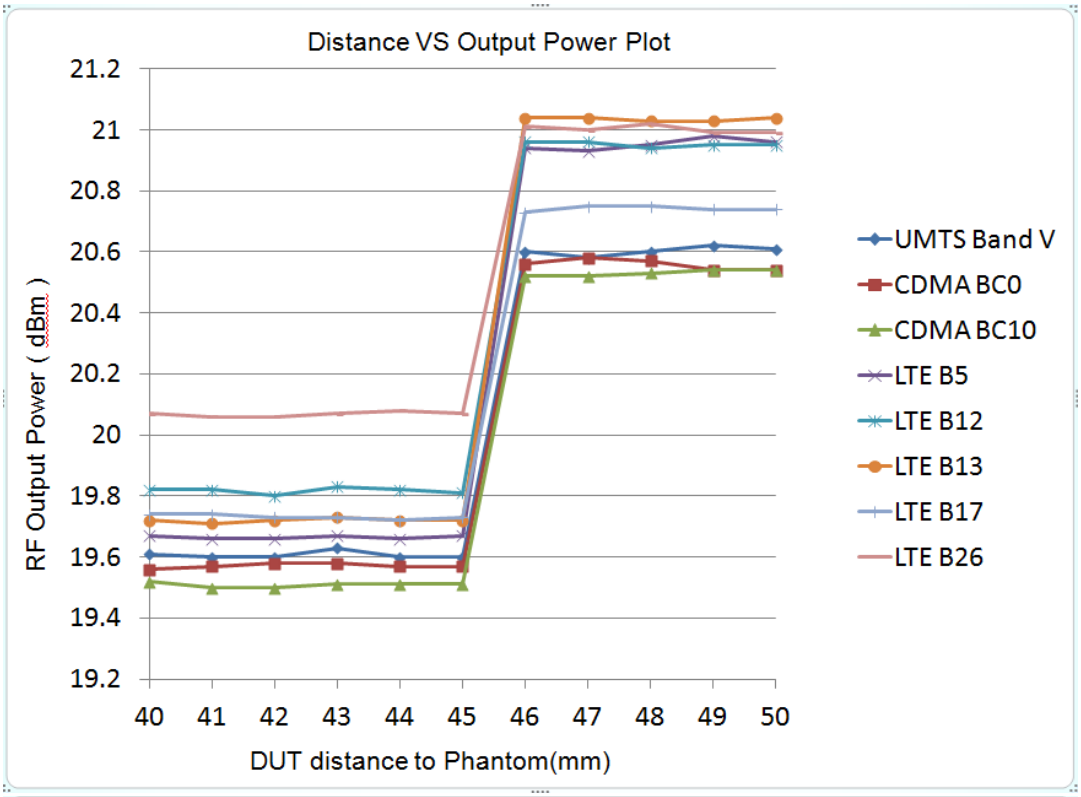


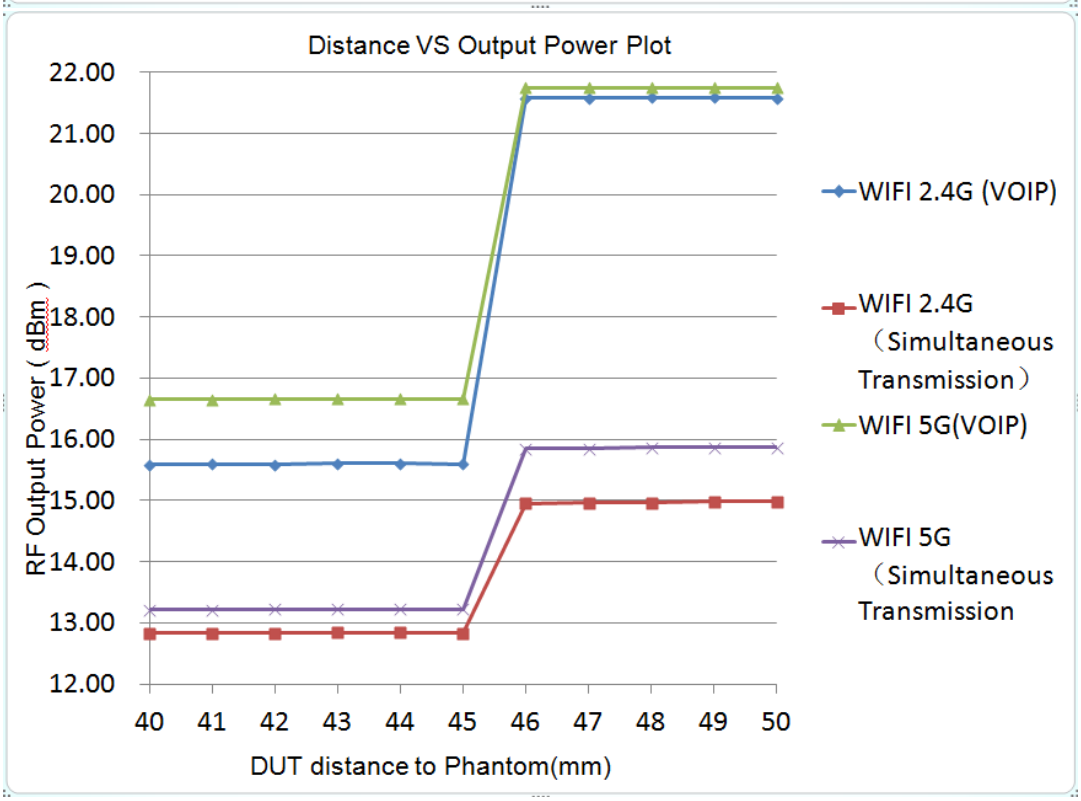




The DUT is moved away from the flat phantom:







Conclusion: The Proximity sensor triggering distance is far more than 15 mm, so it can be ensured that the proximity sensor can be valid triggered for the Head, body-worn and 10g extremity exposure condition(WiFi VOIP or 2G&3G&4G sub antenna voice + WiFi simultaneous transmission).

As Standalone SAR compliance are still tested at the maximum output power level without any power reduction.

2) Procedures for determining antenna and proximity sensor coverage

As the IR proximity sensor locates on the front face of the device and detects objects approaching only from the front side. For front side view, there is no spatial offset between the WiFi antenna/Second antenna and the proximity sensor element, so procedures for determining the proximity sensor coverage per FCC KDB 616217§6.3 does not need to be assessed.

3）Procedures for determining device tilt angle influences to proximity sensor triggering

As the proximity sensor triggering power reduction is only applicable for the front side, so tilt angle influences for the other edges per KDB616217 §6.4 does not need to be assessed.

4) Summary SAR test Plan for Proximity sensor power reduction scenarios

To sum up, as the device uses proximity sensor triggering power reduction during Wi-Fi VOIP or when Wi-Fi antennas transmit simultaneously with the second antenna(Voice) in held-to-ear scenarios,therefore:

For Head SAR compliance:

a) Standalone Head SAR for Wi-Fi antennas(WiFi VOIP)are evaluated at reduced power levels according to the real usage scenarios.

b) Additional Head SAR tests at lower reduced power levels in WiFi and 2G&3G&4G Second antenna(Voice) simultaneous transmission scenarios are also tested for some frequency bands and test positions, which are only used to ensure simultaneous transmission SAR test exclusion.

For 10g Extremity SAR compliance:

a）Standalone SAR compliance are still tested at the maximum output power level without any power reduction. It is more conservative to ensure SAR compliance. So additional SAR test at the sensor triggering distance minus 1mm with the maximum output power level per KDB 616217 is not required.

b) Additional 10g Extremity SAR of front side at proximity sensor triggered reduced power levels are tested for some frequency bands in WiFi and 2G&3G&4G Second antenna simultaneous transmission scenario, which are only used to ensure simultaneous transmission SAR test exclusion.

2) SAR is not tested for this simultaneous transmission reduced power level as the more conservative SAR test results at the maximum output power level without any power reduction are used to satisfy the simultaneous transmission SAR test exclusion.(Refer to Section 7.3 for details)
