1 MAXIMUM PERMISSIBLE EXPOSURE (MPE)

1.1 Standard Applicable

According to KDB 680106 D01 RF Exposure Wireless Charging App v03

RF exposure potential to users and bystanders is expected to vary according to factors inherent to the design of individual systems, which generally requires different evaluation considerations to show compliance.

When exposure concerns arise; for example, due to evolving products and operations, RF exposure evaluation may be requested under the provisions of Sections 1.1307 (c) and (d) to determine compliance. Because of significant variations in design and operating characteristics, the procedures required to evaluate RF exposure compliance for wireless power transfer are considered according to the exposure potentials of individual implementations

The RF exposure requirements must be determined in conjunction with the device operating characteristics, according to the mobile and portable exposure requirements in Sections 2.1091 and 2.1093 of the rules. SAR and MPE limits do not cover the frequency range for wireless power transfer applications which operate below 100 kHz and 300 kHz respectively; therefore, RF exposure compliance needs to be determined with respect to Sections 1.1307 (c) and (d) of the FCC rules.

1.2 Limits for Maximum Permissive Exposure (MPE)

Emissions between 100 kHz to 300 kHz should be assessed versus the limits at 300 kHz in Table 1 of Section 1.1310: 614 V/m and 1.63 A/m. A KDB inquiry is required to determine the applicable exposure limits below 100 kHz.

TABLE 1—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(A) Limits for Occupational/Controlled Exposure				
0.3-3.0	614	1.63	*100	6
3.0-30	1842/f	4.89/f	*900/f ²	6

300-1,500			f/300	6
1,500-100,000			5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3-1.34	614	1.63	*100	30
1.34-30	824/f	2.19/f	*180/f ²	30

CERTIFICATE OF CALIBRATION

For: SGS Taiwan Limited

On behalf of: EMC Instruments corporation
1F, No.8, Lane38 WenSan 3rd street
Kwei-Shan Hsiang Taoyuan Hsien

Instrument: E-field probe

manufacturer	Narda / Wandel & Goltermann
type	EF-0691 + NBM-550
serial number	G-0061 + F-0375
asset number	150000331

Calibration method: The calibration is carried out according to IEC 61000-4-3 (2006-02) + A1 (2007-11) + A2 (2010-03).
 The instrument was allowed to acclimatize for at least 2 hours before any measurements were made.
 During calibration, all axis of the field probe are switched on as in the normal isotropic mode of operation of the probe.
 Up to 150 MHz, the calibration is performed in a TEM cell. The calculated field method is used for the calibration.
 The calibration of frequencies from 200 MHz is carried out in a full anechoic room. Over the frequency range of 200 MHz to 1000 MHz, the standard transfer method is used. For frequencies from 1200 MHz, the calculated field method is used.
 The polarization of the E-field is vertical. For each frequency and field strength setting, the field probe is rotated so that each position is aligned with the E-field. The position under test is always perpendicular to the direction of propagation and parallel to the E-field.
 Page 13 and 14 describes the orientation of the DUT during calibration.

$$\text{Correction Factor} = \frac{\text{Applied field strength}}{\text{Measured field strength}}$$

- Position 1: probe horizontal, perpendicular to the field, display horizontal (up). Probe head aligned with center of the antenna, probe box to the right.
- Position 2: probe horizontal, perpendicular to the field, display aligned vertical, to the front facing the antenna. Probe head aligned with center of the antenna, probe box to the right.
- Position 3: probe horizontal, perpendicular to the field, display horizontal (down). Probe head aligned with center of the antenna, probe box to the right.

The linearity is compared to the limits given by the IEC 61000-4-3 standard as mentioned at page 15.

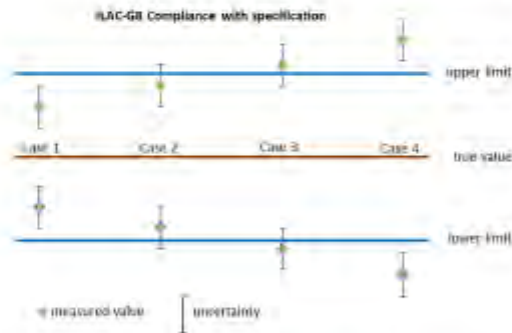

Ambient conditions: The calibration was carried out in a screened room, at an ambient temperature of $(23 \pm 2)^\circ\text{C}$ and a relative humidity of $(50 \pm 10)\%$.

Period of calibration: 2018 February, 20 to 2018 February, 22.

Due date: 2019 February, 22

Results: The results are listed on page 3 to 11.
The results of comparisons with specifications are shown in the column 'Remarks'.
Reported statements comply with ILAC-G8 (2009-03): 'Guidelines on the Reporting of Compliance with Specification'. The following remarks can be reported:

- (a) Case 1 - 'Pass' or no remark if:
The measurement result is within (or below) the specification limit when the measurement uncertainty is taken into account.
- (b) Case 4 - 'Out of specs.' if:
The measurement result is outside (or above) the specification limit when the measurement uncertainty is taken into account.
- (c) Case 2 & 3 - 'Border value' if:
It is not possible to state compliance using a 95% coverage probability for the expanded uncertainty.

No adjustments have been made to the instrument.
The measured values were calculated from a single sample.

Uncertainty: The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k = 2$, which for a normal distribution corresponds to a coverage probability of approximately 95%. The standard uncertainty of measurement has been determined in accordance with EA publication EA-4/02.
