

Operational Description

The transmitter is a low powered, hand held unit for remote controlling the Plug-in remote control and other features. See the function descriptions in attached. The transmitter is powered by a 3 volt battery. It is designed to operate on a single fixed frequency at 315 MHz. See the attached block diagram and schematic.

There are 6 buttons trigger the Microcomputer circuit which produces the digital control signals and will modulate the carrier signal. The carrier signal is generated by a crystal oscillator/ amplifier circuit comprised of a 9. 84375 MHz crystal and a 315MHz Modulate. The modulated output of the RF amplifier stage is coupled to the PCB strip antenna. The strip antenna is attached on PCB permanently around 20 mm.

The transmitter is manually operated by the buttons pushed and will automatically deactivate within 3 seconds after the button being released. This feature is incorporated by the U1 internally.

All tuning and verification are performed by the manufacture and there are no adjustments can be made by the user. No external ground is required or used with this transmitter.
