

QMNRM-429 HAC RF Emissions Test Report, addendum

Question:

Perhaps I missed it, but I did not see in the HAC report where it was shown that the ambient noise level was at least 20dB below the signal measured. Please point to the page this information is on for the 2007 C63.19 test report, or please explain how this was determined during system validation etc.

thanks
Dennis

Answer:

"The item in question is included in measurement uncertainty analysis, which was formulated by following the guidelines stated by DASY 4 system manufacturer. Please see the table under section 6, Measurement Uncertainty on HAC RF Emissions Test Report (Salo_HAC_0825_14)."
