1 Assessment

The following equipment (and as identified in Ch.3 of this test report) was evaluated against the applicable criteria specified in FCC CFR47 Part 15.247, 15.207, 15.209 and Industry Canada Standards RSS 210 Issue 8 and no deviations were ascertained during the course of the tests performed.

Company	Description	Model Number
Harman International	Automotive Infotainment Unit	Boom!™ Box 4.3GT

Responsible for Testing Laboratory:

2013-05-28	Compliance	Franz Engert (Acting Lab Manager)	
Date	Section	Name	Signature

Responsible for the Report:

2013-05-28	Compliance	Daniel Salinas (EMC Engineer)	
Date	Section	Name	Signature

The test results of this test report relate exclusively to the test item specified in Section3. CETECOM Inc. USA does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item. The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CETECOM Inc. USA.

2 Administrative Data

2.1 Identification of the Testing Laboratory Issuing the Test Report

Company Name:	CETECOM Inc.
Department:	Compliance
Address:	411 Dixon Landing Road Milpitas, CA 95035 U.S.A.
Telephone:	+1 (408) 586 6200
Fax:	+1 (408) 586 6299
Test Lab Manager:	Sajay Jose
Test Engineer:	Daniel Salinas

2.2 Identification of the Client

Client:	Harman International
Street Address:	39001 West Twelve Mile Road
City/Zip Code	Farmington Hills MI, 48331
Country	USA
Contact Person:	Shain E. Chmura
Phone No.	+1 (248) 592 3157

2.3 Identification of the Manufacturer

Same as above client.

3 Equipment under Test (EUT)

3.1 Specification of the Equipment under Test

Model No:	Boom! TM Box 4.3GT
HW/SW Revision:	2395479 / 1.16.5
FCC-ID:	QNG-BE2806
IC-ID:	6434C-BE2806
Product Description:	Automotive Infotainment unit
Test Mode:	BT 2.1+ EDR
Frequency Range of test:	ISM Band 2402 – 2480 MHz
Number of channels:	79 Channels 0-78
Type(s) of Modulation:	GFSK, $\pi/4$ DQPSK, 8DPSK
Antenna Information:	Inverted-F PCB antenna, permanently affixed to PCB Max stated gain: 0 dBi
Output Power Summary:	Measured Conducted output power: GFSK: 5.2 dBm/0.0033W; $\pi/4$ DQPSK: 5.8 dBm/0.0038W; 8DPSK: 6.1 dBm/0.0040W Calculated Radiated output power: GFSK: 5.2 dBm/0.0033W; $\pi/4$ DQPSK: 5.8 dBm/0.0038W; 8DPSK: 6.1 dBm/0.0040W
Rated Operating Voltage Range:	9 V _{low} / 12 V _{nom} / 16 V _{high}
Rated Operating temperature range:	-40°C to 65°C
Test sample status:	Production

3.2 Identification of the Equipment Under Test (EUT)

EUT #	Serial Number	HW Version	SW Version	Model
1	26423009D	2395479	1.16.5	Boom!™ Box 6.5GT

3.3 Identification of Accessory Equipment

AE #	Type	Manufacturer	Part Number
1	GPS antenna	WISI	76000222

3.4 Environmental conditions during Test:

The following environmental conditions were maintained during the course of testing:

Ambient Temperature: 20-25°C

Relative humidity: 40-60%

3.5 Dates of Testing:

Feb 12, 2013-Mar 20, 2013.

3.6 Other Testing Notes:

1. Test results from sister variant (Model: Boom!™ Box 6.5GT) which is radio identical, is being used to prove compliance of Boom!™ Box 4.3GT to the applicable requirements.
2. The EUT was set in BT Test mode using a development version of the SW available on the device. In this mode, the unit can be connected to a Bluetooth Tester (R&S CBT) to control different modulation schemes, channels etc., as required for testing.
3. The EUT was tested on low, mid and high channels in GFSK, $\pi/4$ DQPSK and 8DPSK modes.

4 Subject of Investigation

The objective of the measurements applied by CETECOM Inc. was to establish compliance of the EUT as described under Ch. 3 of this Test Report, with the applicable criteria specified in

- FCC CFR47 Parts 15.247, 15.207, 15.209 and
- Industry Canada Radio Standard Specifications RSS-210 Issue 8, RSS-Gen Issue 3

This test report is to support a request for new equipment authorization under the FCC ID: **QNG-BE2806** and IC ID: **6434C-BE2806**.

5 Summary of Measurement Results

Note: NA= Not Applicable; NP= Not Performed.

1. Power Spectral Density is NOT APPLICABLE for devices with hopping functionality.
2. Band Edge compliance-conducted is NOT PERFORMED as the device passes radiated measurement.
3. All results leveraged from sister variant model Boom!™ Box 6.5GT.

6 Measurements

6.1 Measurement Method:

Ref: FCC Public Notice DA 00-705: Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems

6.2 Radiated Measurement Procedure

ANSI C63.4 (2009) Section 8.3.1.1: Exploratory radiated emission measurements

Exploratory radiated measurements shall be performed at the measurement distance or at a closer distance than that specified for compliance to determine the emission characteristics of the EUT. At near distances, for EUTs of comparably small size, it is relatively easy to determine the spectrum signature of the EUT and, if applicable, the EUT configuration that produces the maximum level of emissions. A shielded room may be used for exploratory testing, but may have anomalies that can lead to significant errors in amplitude measurements.

Broadband antennas and a spectrum analyzer or a radio-noise meter with a panoramic display are often useful in this type of testing. It is recommended that either a headset or loudspeaker be connected as an aid in detecting ambient signals and finding frequencies of significant emission from the EUT when the exploratory and final testing is performed in an OATS with strong ambient signals. Caution should be taken if either antenna height between 1 and 4 meters or EUT azimuth is not fully explored. Not fully exploring these parameters during exploratory testing may require complete testing at the OATS or semi-anechoic chamber when the final full spectrum testing is conducted.

The EUT should be set up in its typical configuration and arrangement, and operated in its various modes. For tabletop systems, cables or wires should be manipulated within the range of likely arrangements. For floor-standing equipment, the cables or wires should be located in the same manner as the user would install them and no further manipulation is made. For combination EUTs, the tabletop and floor-standing portions of the EUT shall follow the procedures for their respective setups and cable manipulation. If the manner of cable installation is not known, or if it changes with each installation, cables or wires for floor-standing equipment shall be manipulated to the extent possible to produce the maximum level of emissions.

For each mode of operation required to be tested, the frequency spectrum shall be monitored. Variations in antenna height between 1 and 4 m, antenna polarization, EUT azimuth, and cable or wire placement (each variable within bounds specified elsewhere) shall be explored to produce the emission that has the highest amplitude relative to the limit. A step-by-step technique for determining this emission can be found in Annex C.

When measuring emissions above 1 GHz, the frequencies of maximum emission shall be determined by manually positioning the antenna close to the EUT and by moving the antenna over all sides of the EUT while observing a spectral display. It will be advantageous to have prior knowledge of the frequencies of emissions above 1 GHz. If the EUT is a device with dimensions approximately equal to that of the measurement antenna beamwidth, the measurement antenna shall be aligned with the EUT.

ANSI C63.4 (2009) Section 8.3.1.2: Final radiated emission measurements

Based on the measurement results in 8.3.1.1, the one EUT, cable and wire arrangement, and mode of operation that produces the emission that has the highest amplitude relative to the limit is selected for the final measurement. The final measurement is then performed on a site meeting the requirements of 5.3, 5.4, or 5.5 as appropriate without variation of the EUT arrangement or EUT mode of operation. If the EUT is relocated from an exploratory test site to a final test site, the highest emission shall be remaximized at the final test location before final radiated emissions measurements are performed. However, antenna height and polarity and EUT azimuth are to be varied. In addition, the full frequency spectrum (for the range to be checked for meeting compliance) shall be investigated.

This investigation is performed with the EUT rotated 360°, the antenna height scanned between 1 m and 4 m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. During the full frequency spectrum investigation, particular focus should be made on those frequencies found in exploratory testing that were used to find the final test configuration, mode of operation, and arrangement (associated with achieving the least margin with respect to the limit). This full spectrum test constitutes the compliance measurement.

For measurements above 1 GHz, use the cable, EUT arrangement, and mode of operation determined in the exploratory testing to produce the emission that has the highest amplitude relative to the limit. Place the measurement antenna away from each area of the EUT determined to be a source of emissions at the specified measurement distance, while keeping the antenna in the “cone of radiation” from that area and pointed at the area both in azimuth and elevation, with polarization oriented for maximum response. The antenna may have to be higher or lower than the EUT, depending on the EUT’s size and mounting height, but the antenna should be restricted to a range of heights of from 1 m to 4 m above the ground or reference ground plane. If the transmission line for the measurement antenna restricts its range of height and polarization, the steps needed to ensure the correct measurement of the maximum emissions, shall be described in detail in the report of measurements. Data collected shall satisfy the report requirements of Clause 10.

NOTES

1— Where limits are specified by agencies for both average and peak (or quasi-peak) detection, if the peak (or quasi-peak) measured value complies with the average limit, it is unnecessary to perform an average measurement.

2—Use of waveguide and flexible waveguide may be necessary at frequencies above 10 GHz to achieve usable signal-to noise ratios at required measurement distances. If so, it may be necessary to restrict the height search of the antenna, and special care should be taken to ensure that maximum emissions are correctly measured.

3—All presently known devices causing emissions above 10 GHz are physically small compared with the beam-widths of typical horn antennas used for EMC measurements. For such EUTs and frequencies, it may be preferable to vary the height and polarization of the EUT instead of the receiving antenna to maximize the measured emissions.

Measurement Uncertainty: $\pm 3\text{dB}$

6.3 Sample Calculations for Radiated Measurements

6.3.1.1 Field Strength Measurements:

Measurements from the Spectrum Analyzer/ Receiver is used to calculate the Field Strength, taking into account the following parameters:

1. Measured reading in dB μ V
2. Cable Loss between the receiving antenna and SA in dB and
3. Antenna Factor in dB/m

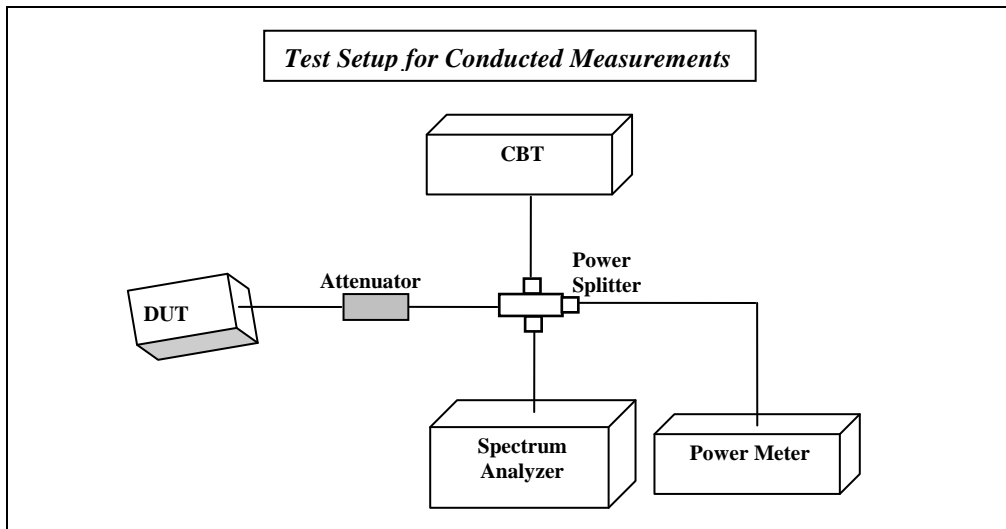

FS (dB μ V/m)= Measured Value on SA (dB μ V)+ Cable Loss (dB)+ Antenna Factor (dB/m)

Eg:

Frequency (MHz)	Measured SA (dB μ V)	Cable Loss (dB)	Antenna Factor Correction (dB)	Field Strength Result (dB μ V/m)
1000	80.5	3.5	14	98.0

All radiated measurement plots in this report are taken from a test SW that calculates the Field Strength based on the above equation.

6.4 Conducted Measurement Procedure

1. Connect the equipment as shown in the above diagram.
2. Adjust the settings of the CBT (Rohde-Schwarz Bluetooth Tester) to connect the EUT at the required channel.
3. Measurements are to be performed with the EUT set to the low, middle and high channels and for GFSK, $\pi/4$ DQPSK and 8DPSK modulation schemes.

6.5 Peak Output Power

6.5.1 Limits:

6.5.1.1 §15.247 (b)(1)

The maximum peak conducted output power of the intentional radiator shall not exceed the following:
For frequency hopping systems operating in the 2400–2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725–5850 MHz band: 1 watt.
For all other frequency hopping systems in the 2400–2483.5 MHz band: 0.125 watts.

6.5.1.2 RSS 210- A8.4(2)

Nominal Peak Output Power < 30 dBm (1W)

6.5.2 Test Conditions:

Tnom: 22°C; Vnom: 12 V

Hopping OFF

6.5.3 Test Procedure:

Measurement according to DA 00-705

Measurement Settings:

Conducted output power measured using a CBT (Bluetooth Tester).

Radiated EIRP calculated using the formula= Conducted Power+ Antenna Gain.

Max. Antenna Gain (dBi): 0 dBi

6.5.4 Test Result:

Measured Peak Output Power - Conducted (dBm)			
Modulation	Frequency (MHz)		
	2402	2441	2480
GFSK	4.8	5.0	5.2
$\pi/4$ DQPSK	5.2	5.8	5.7
8-DPSK	5.7	6.1	6.1

Calculated Peak Output Power- Radiated (dBm)			
Modulation	Frequency (MHz)		
	2402	2441	2480
GFSK	4.8	5.0	5.2
$\pi/4$ DQPSK	5.2	5.8	5.7
8-DPSK	5.7	6.1	6.1

6.5.4.1 Measurement Verdict

Pass.

6.5.5 Spectrum Bandwidth/ 20dB Bandwidth

6.5.6 Limits:

6.5.6.1 §15.247 (a)(1)

6.5.6.2 RSS 210- A8.1(b)

Frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

GFSK < 1000 kHz

$\pi / 4$ DQPSK < 1500 kHz

8 dPSK < 1500kHz

6.5.7 Test Conditions:

Tnom: 22°C; Vnom: 12V

Hopping OFF

6.5.8 Test Procedure:

Measurement according to DA 00-705

Spectrum Analyzer settings:

Span = approximately 2 to 3 times the 20 dB bandwidth, centered on a hopping channel

RBW \geq 1% of the 20 dB bandwidth

VBW \geq RBW

Sweep = auto

Detector function = peak

Trace = max hold

Measurements taken at 20dB below peak.

6.5.9 Test Result:

20dB Bandwidth (kHz)			
Modulation	Frequency (MHz)		
	2402	2441	2480
GFSK	955.1	951.9	948.71
$\pi/4$ DQPSK	1246	1246	1237
8-DPSK	1272	1276	1266
Measurement Uncertainty: ± 10 kHz			

6.5.9.1 Measurement Verdict:

Pass.

6.5.10 Test Data/plots:

6.6 Carrier Frequency Separation

6.6.1 Limits:

§ 15.247 (a) (1)

RSS 210- A8.1(b)

Minimum 25kHz or 2/3 of the 20dB bandwidth of the hopping system

6.6.2 Test Conditions:

Tnom: 22 C; Vnom: 12V

Hopping ON

6.6.3 Test Procedure:

Measurement according to DA 00-705

Spectrum Analyzer settings:

Span = wide enough to capture the peaks of two adjacent channels

Resolution (or IF) Bandwidth (RBW) \geq 1% of the span

Video (or Average) Bandwidth (VBW) \geq RBW

Sweep = auto; Detector function = peak; Trace = max hold

6.6.4 Test Data/plot:

Date: 12.FEB.2013 12:43:25

6.6.4.1 Measurement Verdict:

Pass.

6.7 Number of hopping channels

6.7.1 Limits:

§ 15.247 (a) (1)

RSS 210- A8.1(d)

Atleast 15 non-overlapping channels

6.7.2 Test Conditions:

Tnom: 22°C; Vnom: 12 V

Hopping ON

6.7.3 Test Procedure:

Measurement according to DA 00-705

Spectrum Analyzer settings:

Span = the frequency band of operation

RBW \geq 1% of the span

VBW \geq RBW

Sweep = auto; Detector function = peak; Trace = max hold

6.7.4 Test Data/plot:

Date: 12.FEB.2013 12:29:27

6.7.4.1 Measurement Verdict

Pass.

6.8 Time of occupancy (Dwell time)

6.8.1 Limits:

§ 15.247 (a) (1) (iii)

RSS 210- A8.1(d)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

6.8.2 Test Conditions:

Tnom: 22°C; Vnom: 12 V

Hopping ON

6.8.3 Test Procedure:

Measurement according to DA 00-705

Spectrum Analyzer settings:

Span = zero span, centered on a hopping channel

RBW = 1 MHz

VBW ≥ RBW

Sweep = as necessary to capture the entire dwell time per hopping channel

Detector function = peak

Trace = max hold

6.8.4 Test Result:

Packet Type	Tx-on Time (ms)	Max. number of transmissions per channel in 31.6 sec	Dwell Time (ms)= (Pulse width * Number of transmissions)	Limit (ms)
DH-1	0.4	320.1	128.0	400
DH-3	1.7	161.16	274.0	400
DH-5	2.9	106.176	307.9	400

6.8.4.1 Measurement Verdict

Pass.

DH-1 Mode:

Date: 12.FEB.2013 13:15:38

DH-3 mode:

Date: 12.FEB.2013 13:14:42

DH-5 mode:

Date: 12.FEB.2013 13:13:35

6.9 Spurious RF Conducted Emissions

6.9.1 Reference and Limits:

6.9.1.1 § 15.247 (d)

6.9.1.2 RSS 210-A8.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the radio frequency power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

-20dBc in the frequency range 30MHz- 25GHz.

6.9.2 Test Conditions:

Tnom: 22°C; Vnom: 12 V

Hopping OFF

6.9.3 Test Procedure:

Measurement according to DA 00-705

Spectrum Analyzer settings:

Span = Full

RBW = 100 kHz; VBW ≥ RBW

Sweep = auto

Detector function = peak; Trace = max hold

6.9.4 Test Result:

Conducted Spurious Emissions 8PSK 2480MHz

Date: 12.FEB.2013 12:50:00

6.10 Band Edge Compliance of Radiated Emissions

6.10.1 References:

FCC CFR §2.1053

RSS-210 A8.5

6.10.2 Limits: §15.247/15.205

(a) Except as shown in paragraph (d) of this section, only spurious emissions are permitted in any of the frequency bands listed below:

MHz	MHz	MHz	GHz
0.090 - 0.110	16.42 - 16.423	399.9 - 410	4.5 - 5.15
¹ 0.495 - 0.505	16.69475 - 16.69525	608 - 614	5.35 - 5.46
2.1735 - 2.1905	16.80425 - 16.80475	960 - 1240	7.25 - 7.75
4.125 - 4.128	25.5 - 25.67	1300 - 1427	8.025 - 8.5
4.17725 - 4.17775	37.5 - 38.25	1435 - 1626.5	9.0 - 9.2
4.20725 - 4.20775	73 - 74.6	1645.5 - 1646.5	9.3 - 9.5
6.215 - 6.218	74.8 - 75.2	1660 - 1710	10.6 - 12.7
6.26775 - 6.26825	108 - 121.94	1718.8 - 1722.2	13.25 - 13.4
6.31175 - 6.31225	123 - 138	2200 - 2300	14.47 - 14.5
8.291 - 8.294	149.9 - 150.05	2310 - 2390	15.35 - 16.2
8.362 - 8.366	156.52475 - 156.52525	2483.5 - 2500	17.7 - 21.4
8.37625 - 8.38675	156.7 - 156.9	2690 - 2900	22.01 - 23.12
8.41425 - 8.41475	162.0125 - 167.17	3260 - 3267	23.6 - 24.0
12.29 - 12.293	167.72 - 173.2	3332 - 3339	31.2 - 31.8
12.51975 - 12.52025	240 - 285	3345.8 - 3358	36.43 - 36.5
12.57675 - 12.57725	322 - 335.4	3600 - 4400	(²)
13.36 - 13.41			

15.209 (a) Emission Limits:

The emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (m)
0.009–0.490	2400/F(kHz)	300
0.490–1.705	24000/F(kHz)	30
1.705–30.0	30	30
30–88	100**	3
88–216	150**	3
216–960	200**	3
Above 960	500	3

6.10.3 Test Conditions:

Tnom: 22°C; Vnom: 12 V

Hopping OFF

6.10.4 Measurement Procedure:

Peak measurements are made using a peak detector and RBW=1MHz.

*PEAK LIMIT= 74dB μ V/m

Average measurements performed using a peak detector and according to video averaging procedure with RBW=1MHz and VBW=10Hz.

*AVG. LIMIT= 54dB μ V/m

6.10.4.1 Measurement Verdict

Pass.

6.10.5 Test Data/plots:

Lower band edge peak -GFSK modulation

Lower band edge average -GFSK modulation

Higher band edge peak -GFSK modulation

Higher band edge average-GFSK modulation

Lower band edge peak - $\pi/4$ DQPSK modulation

Lower band edge average - $\pi/4$ DQPSK modulation

Higher band edge peak $-\pi/4$ DQPSK modulation

Higher band edge average $-\pi/4$ DQPSK modulation

Lower band edge peak - 8DPSK modulation

Higher band edge peak - 8DPSK modulation

Higher band edge average-8DPSK modulation

6.11 Transmitter Spurious Emissions- Radiated

6.11.1 Limits:

§15.247/15.205

RSS-Gen Section 4.9; RSS 210-A8.5

Frequency of emission (MHz)	Field strength ($\mu\text{V/m}$)	Measurement Distance (m)
0.009–0.490	2400/F(kHz)	300
0.490–1.705	24000/F(kHz)	30
1.705–30.0	30	30

Frequency of emission (MHz)	Field strength ($\mu\text{V/m}$)
30–88	100 (40dB $\mu\text{V/m}$)
88–216	150 (43.5 dB $\mu\text{V/m}$)
216–960	200 (46 dB $\mu\text{V/m}$)
Above 960	500 (54 dB $\mu\text{V/m}$)

6.11.2 Test Result:

The device was set to operate in 8DPSK test mode (highest conducted output power) and measurement results as reported here, represent the worst case radiated spurious emissions.

Unless mentioned otherwise, the emissions outside the limit lines in the plots are from the transmit signal.

For radiated measurements, all data in this report shows the worst case emissions data between H/V antenna polarizations and for all 3 orthogonal orientations of the EUT.

6.11.3 Test Conditions:

Tnom: 22°C; Vnom: 12 V

Hopping OFF

6.11.4 Measurement Procedure:

Peak measurements are made using a peak detector and RBW=120kHz (<1GHz) and RBW= 1MHz (>1GHz)

For the measurement range below 30 MHz in the following plots the field strength results from 3m distance measurement are extrapolated to 300m and 30m distance respectively, by 40dB/decade, according to part 15.31(f)(2), per antenna factor scaling.

6.11.4.1 Measurements Verdict

Pass.

6.11.5 Test data/ plots: Transmitter Radiated Spurious Emission- Ch0- 30M-1GHz

Equipment used meets the measurement uncertainty requirements as required per applicable standards for 95% confidence levels.

Calibration due dates, unless defined specifically, falls on the last day of the month.

Items indicated "N/A" for cal status either do not specifically require calibration or is internally characterized before use.
