### EUT Test Conditions during Testing

The EUT was in continuous transmit mode during all the tests. The hopping was stopped and the EUT was configured into the wanted channel using software provided by the manufacturer. Normal modulation and duty cycle was applied in all the tests.

Conducted measurements were performed while the EUT was connected to WSTK development board. Conducted measurements were performed to E variant sample.

Radiated measurements with A variant were performed while the EUT was placed on simplified board with reduced functionality.

Following channels were used during the tests when the hopping was stopped:

Channel Low (Ch 0) = 2402 MHz

Channel Mid (Ch 19) = 2440 MHz

Channel High (Ch 39) = 2480 MHz

Power setting 199 was used for A variant and power setting 186 for E variant during radiated measurements.

Power setting 186 was used for conducted measurements. Other settings in table below were same for all tests.

PHY	Low energy transmit	Packet Length
1M	PRBS9 (GFSK)	255

## TEST RESULTS

### Conducted Emissions In The Frequency Range 150 kHz - 30 MHz

**Standard:** ANSI C63.10 (2013)  
**Tested by:** EHA  
**Date:** 2 August 2017  
**Temperature:** 22 °C  
**Humidity:** 44 % RH  
**Barometric pressure:** 1001 hPa  
**Measurement uncertainty:** ± 2.9 dB Level of confidence 95 % (k = 2)

FCC Rule: 15.207 (a)  
RSS-GEN 8.8

Conducted disturbance voltage was measured with an artificial main network from 150 kHz to 30 MHz with 4.5 kHz steps and a resolution bandwidth of 9 kHz. Measurements were carried out with peak and average detectors.

**Maximum Peak Conducted Output Power**

**Standard:** ANSI C63.10 (2013)  
**Tested by:** JAT  
**Date:** 23 November 2017  
**Temperature:** 23 ± 3 °C  
**Humidity:** 20 - 60 % RH  
**Measurement uncertainty:** ± 2.87dB Level of confidence 95 % (k = 2)

**FCC Rule: 15.247(b)(3)**  
**RSS-247 5.4(d)**

For systems using digital modulation in the 2400-2483.5 MHz bands the limit is 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power.

Measured values are peak values.

**Results:**

**Table 3:** Maximum conducted output power

Channel	Conducted Power [dBm]	Limit [dBm]	Margin [dBm]	Result
Low	16.99	30	13.01	PASS
Mid	16.82	30	13.18	PASS

## Transmitter Radiated Spurious Emissions 30 - 26500 MHz

**Standard:** ANSI C63.10 (2013)  
**Tested by:** EHA & JAT  
**Date:** 26 July 2017 - 8 August 2017  
**Temperature:** 23 ± 3 °C  
**Humidity:** 20 - 60 % RH

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a).

The correction factor in the final result table contains the sum of the transducers (antenna + amplifier + cables). Peak values of emissions below 1000 MHz measured for reference as well as transmitter fundamental. Measurements were performed for both antenna variants.

### FCC Rule: 15.247(d), 15.209(a) RSS-247 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).
