### 2.1.2 Standard Applicable

(1) For frequency hopping systems operating in the 2400–2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725–5850 MHz band: 1 watt.  
For all other frequency hopping systems in the 2400–2483.5 MHz band: 0.125 watts.

### 2.1.3 Equipment Under Test and Modification State

Serial No: N/A / Default Test Configuration

### 2.1.4 Date of Test/Initial of test personnel who performed the test

January 04, 2013/FSC

### 2.1.5 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

### 2.1.6 Environmental Conditions

Ambient Temperature	20.8°C
Relative Humidity	16.7%
ATM Pressure	99.8 kPa

### 2.1.7 Additional Observations

- This is a radiated test. Fundamental test results are from Spurious Radiated Emissions scans under Section 2.2 of this test report.
- The field strength measurement in dB $\mu$ V/m is then converted to power in watts using the formula:

$$P = (E^2 \cdot d) / 30G$$

Where: P = power in watts

E = measured maximum fundamental field strength in V/m

d = measurement distance in meters

G = numeric gain of the transmitting antenna with reference to an isotropic radiator

- Formula used to convert dB $\mu$ V/m to V/m is:  $V/m = 10^{((dB\mu V/m)-120)/20}$
- Formula used to convert antenna gain in dbi to numeric gain is: Numeric gain =  $10^{(dbi/10)}$
- Antenna gain used in calculation is 0dBi.

### 2.1.8 Test Results

See attached table:

Channel	Frequency (MHz)	Radiated Max Peak (dB $\mu$ V/m)	Radiated Max Peak (V/m)	Calculated Peak Power (Watts)	Original Grant Output Power (Watts)

## 2.2 SPURIOUS RADIATED EMISSIONS

### 2.2.1 Specification Reference

Part 15 Subpart C §15.247(d)

### 2.2.2 Standard Applicable

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

### 2.2.3 Equipment Under Test and Modification State

Serial No: N/A / Default Test Configuration

### 2.2.4 Date of Test/Initial of test personnel who performed the test
