FCC Certification Test Report for the Mars Electronics (MEI) easitraxTM

FCC ID: QP8EASITRAX

April 19, 2007

WLL JOB# 9554

Prepared by: Brian J. Dettling Documentation Specialist

Reviewed by: Steven D. Koster EMC Operations Manager

Abstract

This report has been prepared on behalf of Mars Electronics (MEI) to support the attached Application for Equipment Authorization. The test report and application are submitted for an Intentional Radiator under Part 15.225 of the FCC Rules and Regulations. This Certification Test Report documents the test configuration and test results for a Mars Electronics (MEI) easitraxTM.

Testing was performed on an Open Area Test Site (OATS) of Washington Laboratories, Ltd, 7560 Lindbergh Drive, Gaithersburg, MD 20879. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. Washington Laboratories, Ltd. has been accepted by the FCC and approved by NIST NVLAP (NVLAP Lab Code: 200066-0) as an independent FCC test laboratory.

The Mars Electronics (MEI) easitraxTM complies with the limits for an Intentional Radiator device under FCC Part 15.225.

1 Introduction

1.1 Compliance Statement

The Mars Electronics (MEI) easitrax[™] complies with the limits for an Intentional Radiator device under FCC Part 15.225.

1.2 Test Scope

Tests for radiated and conducted emissions were performed. All measurements were performed in accordance with the 2003 version of ANSI C63.4. The measurement equipment conforms to ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation.

1.3 Contract Information

Customer:	Mars Electronics (MEI) 1301 Wilson Drive West Chester, PA 19380
Purchase Order Number:	4500043252
Quotation Number:	63378
1.4 Test Dates Testing was performed on the following date(s):	January 23 and February 15, 2007
1.5 Test and Support Personnel

2 Equipment Under Test

2.1 EUT Identification & Description

The Mars Electronics (MEI) easitrax[™] is comprised of the Cashflow SC66 Series Bill Validator. It is a digital signal processor based currency recognition acceptor used primarily in the Gaming or Retail industry to validate and store legitimate currency and issue credit to its host machine. The validator consist of a chassis, removable bill cassette (with RF tag installed), acceptor module (with control PCB, LED PCB, sensor PCBs, and transport motors), an interface PCB, antenna PCB, and interface cable. The antenna PCB couples to the I/F PCB and is downward looking in order to communicate with the RF tag. Power is supplied to the acceptor module via the interface cable which provides 24Vdc, normally supplied from the 120Vac host machine.

ITEM	DESCRIPTION
Manufacturer:	Mars Electronics (MEI)
FCC ID:	QP8EASITRAX
Model:	easitrax TM
FCC Rule Parts:	§15.225
Frequency Range:	13.56MHz
Maximum Output Power:	109.2 µV/m at 10 meters
Modulation:	None
Occupied Bandwidth:	2.23 kHz
Type of Information:	Data
Number of Channels:	1
Power Output Level	Fixed
Antenna Type	Internal PCB
Frequency Tolerance:	>±0.01% (±100 ppm)
Interface Cables:	Power
Power Source & Voltage:	24Vdc from 120Vac

Table 1. Device Summary

2.2 Test Configuration

The easitraxTM was configured for testing as indicated in the figure below.

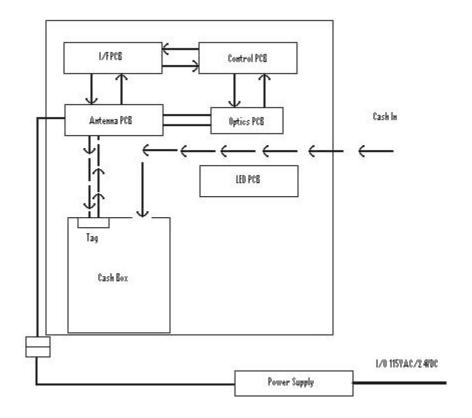

Figure 1: Test Configuration

2.3 Testing Algorithm

The Reader operates at 13.56MHz.

The Reader talks to the RF Tag on the lower side at 156KHz modulation. This is Miller Encoded.

The RF tag responds to the Reader using the Manchester Protocol. The Tag does not emit; rather it shorts the Reader's field in a binary response.

Functionality:

The Reader checks for the presence of an RF tag in its field twice a second. This check takes about 20ms.

After a Cash Box is installed the system reads and writes the 16 Char Asset number. This process takes about 4 seconds. There are several 20ms reads and writes during this time.

Worst case emission levels are provided in the test results data.

2.4 Test Location

All measurements herein were performed at Washington Laboratories, Ltd. test center in Gaithersburg, MD. Site description and site attenuation data have been placed on file with the FCC's Sampling and Measurements Branch at the FCC laboratory in Columbia, MD. Washington Laboratories, Ltd. has been accepted by the FCC and approved by NIST NVLAP (NVLAP Lab Code: 200066-0) as an independent FCC test laboratory.

2.5 Measurements

2.5.1 References

ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation

ANSI C63.4 American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz

Land Mobile FM or PM Communications Equipment Measurement and Performance Standards (ANSI/TIA/EIA-603-93)

2.6 Measurement Uncertainty

All results reported herein relate only to the equipment tested. For the purposes of the measurements performed by Washington Laboratories, the measurement uncertainty is ± 2.3 dB. This has been calculated for a *worst-case situation* (radiated emissions measurements performed on an open area test site).

The following measurement uncertainty calculation is provided:

Total Uncertainty =
$$(A^2 + B^2 + C^2)^{1/2}/(n-1)$$

where:

A = Antenna calibration uncertainty, in dB = 2 dB

B = Spectrum Analyzer uncertainty, in dB = 1 dB

C = Site uncertainty, in dB = 4 dB

n = number of factors in uncertainty calculation = 3

Thus, Total Uncertainty = $0.5 (2^2 + 1^2 + 4^2)^{1/2} = \pm 2.3 \text{ dB}.$

3 Test Equipment

4 Test Results

4.1 Occupied Bandwidth

Occupied bandwidth measurement was performed by coupling the output of the EUT to the input of a spectrum analyzer.

The occupied bandwidth was measured as shown:

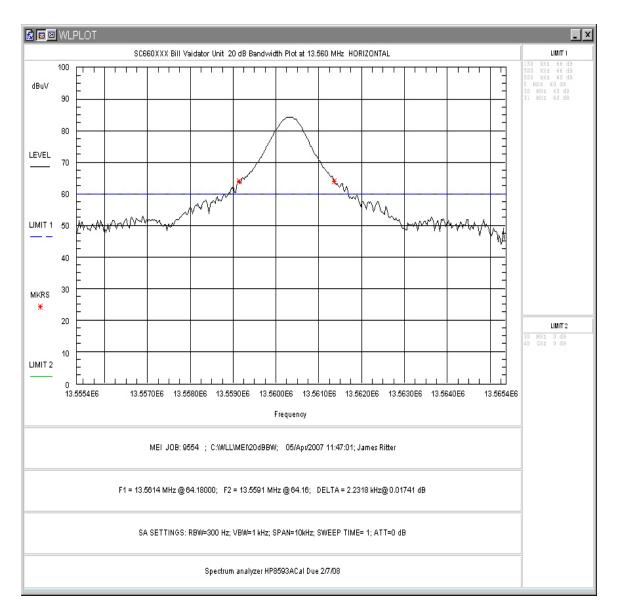

Figure 2. Occupied Bandwidth

Table 3 provides a summary of the Occupied Bandwidth Results.

Frequency	Bandwidth	Limit	Pass/Fail
13.560MHz	2.23 kHz	N/A	Pass

Table 3: Occupied Bandwidth Results

4.2 Radiated Spurious Emissions: §15.225, §15.209

Radiated emissions from the EUT must comply with the field strength limits as specified in FCC Part 15.225 and 15.209. The limits for the radiated emissions are as shown in the following table.

Frequency	Limit	Rule Part Reference
(MHz)	(µV/m)	
13.553 - 13.567	15,848 (@ 30m)	§15.225(a)
13.410 - 13.553	334 (@ 30m)	§15.225(b)
13.567 - 13.710	334 (@ 30m)	§15.225(b)
13.110 - 13.410	106 (@ 30m)	§15.225(c)
13.710 - 14.010	106 (@ 30m)	§15.225(c)
1.705 - 13.110	30 (@ 30m)	§15.225(d), §15.209
14.010 - 30.0	50 (@ 50m)	§15.225(d), §15.207
30.00 - 88.00	100 (@ 3m)	§15.225(d), §15.209
88.00 - 216.00	150 (@ 3m)	§15.225(d), §15.209
216.00 - 960.00	200 (@ 3m)	§15.225(d), §15.209
Above 960	500 (@ 3m)	§15.225(d), §15.209

Table 4: Radiated Spurious Emissions Limits

4.2.1 Test Procedure

The EUT was placed on motorized turntable for radiated testing on an Open Area Test Site. The emissions from the EUT were measured continuously at every azimuth by rotating the turntable. Receiving antennas were mounted on an antenna mast to determine the height of maximum emissions. The height of the antenna was varied between 1 and 4 meters. The peripherals were placed on the table in accordance with ANSI C63.4-2003. Cables were varied in position to produce maximum emissions. Both the horizontal and vertical field components were measured

Testing at frequencies below 30 MHz was performed at ten meters with a loop antenna. The 30 meter limits were used, and because the unit has power so low, the limit was not changes. The unit complies with the 30 meter limit at 10 meters. Three orientations of the loop antenna were tested.

Emissions were scanned up to 1 GHz. Only the fundamental frequency was detected. No other emissions were detected that were related to the RFID Transmitter. All other emissions detected were related to digital emissions of the IUS electronics. Since the EUT is used in a commercial application, these digital emissions were compared to the Class A limit of §15.109(b). For emissions up to 30 MHz peak levels were recorded. Emissions from 30 MHz to 1000 MHz were measured using a Quasi-peak detector. Worst-case emissions are reported in the data table.

The following is a sample calculation used in the data tables for calculating the final field strength of spurious emissions and comparing these levels to the specified limits.

Sample Calculation:

Spectrum Analyzer Voltage (SA Level):	VdBµV
Antenna Factor (Ant Corr):	AFdB/m
Cable Loss Correction (Cable Corr):	CCdB
Amplifier Gain:	GdB (if applicable)
Electric Field (Corr Level):	$EdB\mu V/m = VdB\mu V + AFdB/m + CCdB - GdB$
To convert to linear units:	$E\mu V/m = antilog (EdB\mu V/m/20)$
4.2.2 Test Results	

The EUT complies with the radiated emission requirements of §15.225.

Frequency (MHz)	Polarity H/V	Az Deg	Ant. Height (m)	SA Level (QP) (dBµV)	Ant. Corr. (dB/m)	Cable Corr. (dB)	Corr. Level (dBµV/m)	Corr. Level (µV/m)	Limit (µV/m)	Margin (dB)

4.3 Frequency Stability: (FCC Part §2.1055)

Frequency as a function of temperature and voltage variation shall be maintained within the FCCprescribed tolerances. Per 15.225(e) the frequency tolerance shall be maintained within $\pm 0.01\%$ of the reference frequency.

4.3.1 Test Procedure

The temperature stability was measured with the unit in an environmental chamber used to vary the temperature of the sample. The sample was held at each temperature step to allow the temperature of the sample to stabilize.

The frequency stability of the transmitter was examined at the voltage extremes and for the temperature range of -30° C to $+50^{\circ}$ C. The carrier frequency was measured while the EUT was in the temperature chamber. The reference frequency of the EUT was measured at the ambient room temperature with the frequency counter.

The frequency stabilities can be maintained to a lesser temperature range provided that the transmitter is automatically inhibited from operating outside the lesser temperature range.

The RF carrier frequency shall not depart from the reference frequency (reference frequency is the frequency at 20°C and rated supply voltage) in excess of +/-1356 Hz.

The EUT is powered by 6Vdc voltage supplied via an external DC power supply.

4.3.2 Test Results

The EUT complies with the temperature stability requirements of FCC §15.225(e). Test results are given in Table 7.

Temperature (Centigrade)	Frequency (MHz)	Difference (Hz)	Deviation (%) 0	
Ambient	13.560350	0.0		
-20	13.560480	130.0	0.000959	
-10	13.560500	150.0	0.001106	
0	13.560450	100.0	0.000737	
10	13.560400	50.0	0.000369	
20	13.560430	80.0	0.000590

40	13.560330	-20.0	0.000147	
50	13.560400	50.0	0.000369	

Table 7: Frequency Stability Test Data

Voltage (Volts)	Frequency (MHz)	Difference (Hz)	Deviation (%)	Voltage (Volts)
At rated	13.560330	0	0.0	120VAC
At 85%	13.560330	0	0.000000	102VAC
At 115%	13.560350	-20	0.000147	138VAC

4.4 Conducted Emissions (AC Power Line)

The EUT was placed on an 80 cm high 1 x 1.5 m non-conductive table above a ground plane. Power to the EUT was provided through a Solar Corporation 50 $\Omega/50 \mu$ H Line Impedance Stabilization Network bonded to a 3 x 2 meter ground plane. The LISN has its AC input supplied from a filtered AC power source. Power and data cables were moved about to obtain maximum emissions.

The 50 Ω output of the LISN was connected to the input of the spectrum analyzer and the emissions in the frequency range of 150 kHz to 30 MHz were measured. The detector function was set to quasi-peak or peak, as appropriate, and the resolution bandwidth during testing was at least 9 kHz, with all post-detector filtering no less than 10 times the resolution bandwidth.

The unit was tested with the antenna terminated.

AC Power Line conducted emissions test data are included in Table 8.
