1.0 Introduction

This report is designed to show compliance of the 900 MHz transceiver with the requirements of FCC Part 15 Subpart C (15.247) and RSS-247. This test report covers only the FHSS radio.

1.1 Summary of Tests

| TEST | Reference FCC | Reference Industry Canada | RESULTS |
|---------------------------------------------------|------------------------------|--------------------------------------|--------------------------------------------|
| RF Output Power | 15.247(b) | RSS-247, 5.4.b) | Complies |
| 20-dB Bandwidth | 15.247(a)(1) | RSS-247, 5.1.a) | Complies |
| Channel Separation | 15.247(a)(1) | RSS-247, 5.1.b) | Complies |
| Number of Hopping Channels | 15.247(a)(1) | RSS-247, 5.1.d) | Complies |
| Average Channel Occupancy Time | 15.247(a)(1) | RSS-247, 5.1.d) | Complies |
| Out-of-Band Antenna Conducted Emission | 15.247(d) | RSS-247, 5.5 | Complies |
| Transmitter Radiated Emissions | 15.247(d), 15.209, 15.205 | RSS-GEN | Complies |
| RF Exposure | 15.247(i) | RSS-102 | Complies |

2.0 General Description

2.1 Product Description

Smart Wires, Inc. supplied the following description of the EUT:

The PowerLine Coordinator is a rugged and reliable communication device that serves as an intermediary between the Smart Wires Field Devices (SWFDs) for power flow control and the PowerLine Gateway™. It is responsible for managing the industrial Scientific and Medical (ISM) mesh and communication with the PowerLine Gateway for control and status reporting. The communication with PowerLine Gateway is done via proprietary and secure, authenticated protocol over TCP/IP. The PowerLine Coordinator is a robust and reliable communication device that acts on behalf of PowerLine Gateway™.

For more information, see user's manual provided by the manufacturer.

Information about the 900 MHz radio is presented below:

| | |
|-------------------------------------|----------------------------------------------------------------------|
| Applicant | Smart Wires, Inc. |
| Model No. | P105467 |
| FCC Identifier | QPS01007 |
| IC Identifier | 22326-01007 |
| Type of Transmission | Frequency Hopping Spread Spectrum |
| Rated RF Output | 19.48 dBm |
| Antenna(s) & Gain | PowerLine Coordinator™ - External Antenna, Gain: 5.00 dBi |
| Frequency Range | 902.400 – 926.944 MHz |
| Number of Channel(s) | 64 |
| Modulation Type | 2-FSK |
| Applicant Name & Address | Smart Wires, Inc. 3292 Whipple Rd. Union City, CA 94587 USA |

EUT receive date: June 01, 2018

EUT receive condition: The pre-production version of the EUT was received in good condition with no apparent damage. As declared by the Applicant, it is identical to the production units.

Test start date: June 07, 2018

Test completion date: June 25, 2018

The test results in this report pertain only to the item tested.

2.2 Related Submittal(s) Grants

None.

2.3 Test Methodology

Antenna conducted measurements were performed according to the FCC documents “GUIDANCE FOR COMPLIANCE MEASUREMENTS ON DIGITAL TRANSMISSION SYSTEM, FREQUENCY HOPPING SPREAD SPECTRUM SYSTEM, AND HYBRID SYSTEM DEVICES OPERATING UNDER SECTION 15.247 OF THE FCC RULES” (KDB 558074 D01 DTS Meas Guidance v05r02), and RSS-247 Issue 2, RSS-GEN Issue 5.

Radiated emissions and AC mains conducted emissions measurements were performed according to the procedures in ANSI C63.4:2014 and ANSI C63.10:2013. Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "Data Sheet" of this report.

Following is the channel test plan:

| Channels in 900 MHz band | | | |
|--------------------------|----|----------------|--------|
| Test Channel | | Frequency, MHz | Tested |
| Low | 0 | 902.400 | √ |
| Middle | 32 | 914.867 | √ |
| High | 63 | 926.944 | √ |

2.4 Test Facility

The test site used to collect the radiated data is site 1 (10-m semi-anechoic chamber). This test facility and site measurement data have been fully placed on file with the FCC, IC and A2LA accredited.

3.0 System Test Configuration

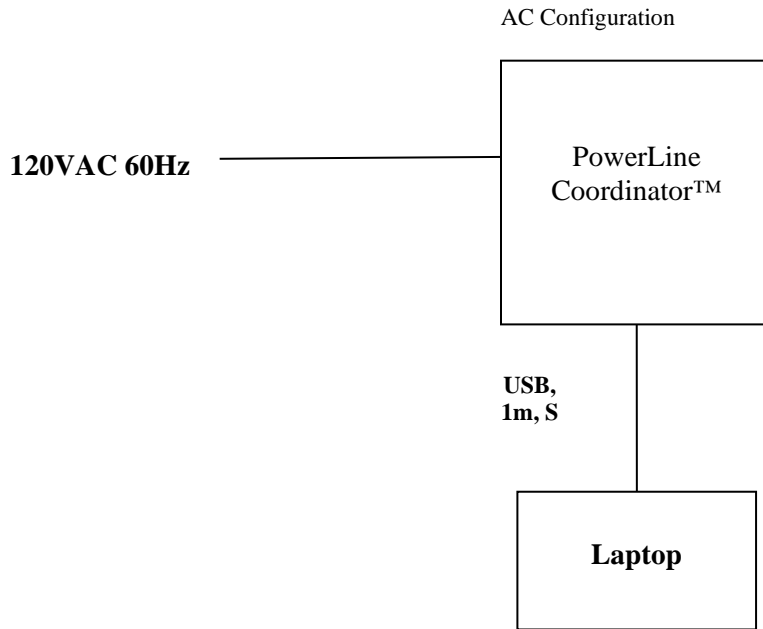

3.1 Support Equipment

| Description | Manufacturer | Model Number |

Antenna was removed and co-axial connector with a cable was installed for Conducted Measurements.

Antenna was removed and co-axial connector with a cable was installed for Conducted Measurements.

DC Configuration

| | |
|----------------------------------------------|--------------------------------------------------------|
| S = Shielded U = Unshielded | F = With Ferrite m = Length in Meters |
|----------------------------------------------|--------------------------------------------------------|

3.3 Justification

For radiated emission measurements the EUT is placed on a non-conductive table. The EUT is attached to peripherals and they are connected and operational (as typical as possible). The EUT is wired to transmit full power. During testing, all cables are manipulated to produce worst-case emissions.

3.4 Mode of Operation During Test

During transmitter testing, the transmitter was setup to transmit continuously at maximum RF power on the low channel, middle channel, high channel and with hopping channels enabled.

The Maximum power allowed by the manufacturer's provided GUI is RF Power = 19

3.5 Modifications Required for Compliance

Intertek installed no modifications during compliance testing in order to bring the product into compliance.

3.6 Additions, Deviations and Exclusions from Standards

No additions, deviations or exclusions from the standard were made.

4.0 Emissions Measurement Results

**4.1 20dB Bandwidth, and 99% Occupied Bandwidth
FCC Rule 15.247(a)(1)**

4.1.1 Procedure

The Procedure described in the ANSI C63.10:2013 for Frequency Hopping Spread Spectrum Systems was used to determine the 20dB bandwidth.

- Span = Approximately 2 to 3 times the 20dB bandwidth, centered on a hopping channel
- RBW = 1% of the 20dB bandwidth
- VBW = 3 x RBW
- Sweep = Auto
- Detector function = Peak
- Trace = Max hold

The EUT should be transmitting at its maximum data rate. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker delta function to measure 20 dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the 20 dB bandwidth of the emission. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. Submit this plot(s).

For 99% power bandwidth measurement, the bandwidth was determined by using the built-in 99% occupied bandwidth function of the spectrum analyzer.

The antenna port of the EUT was connected to the input of a spectrum analyzer (SA). For each RF output channel investigated, the spectrum analyzer center frequency was set to the channel carrier. A Peak output reading was taken, a Display line was drawn for 20dB lower than Peak level. The 20dB bandwidth was determined from where the channel output spectrum intersected the display line.

|---------------------|--------------|
| Anderson Soungpanya | June 7, 2018 |

4.1.2 Test Result

| Frequency MHz | 20 dB FCC Bandwidth, MHz | 99% Bandwidth, MHz | Plot # |
|------------------|-----------------------------|-----------------------|--------|
| 902.400 | 0.34425 | 0.32700 | 1.1 |
| 914.867 | 0.34450 | 0.32325 | 1.2 |
| 926.944 | 0.34125 | 0.32250 | 1.3 |

For frequency hopping systems operating in the 902-928 MHz band, the maximum allowed 20 dB bandwidth of the hopping channel is 0.500 MHz.

| | |
|----------------|----------|
| Results | Complies |
|----------------|----------|

4.2 Conducted Output Power at Antenna Terminals
FCC Rule 15.247(b)(1)

4.2.1 Requirement

For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels

4.2.2 Procedure

The Procedure described in the ANSI C63.10:2013 for Frequency Hopping Spread Spectrum Systems was used to determine the RF Output Power.

- Span = approximately 5 times the 20 dB bandwidth, centered on a hopping channel
- RBW > the 20 dB bandwidth of the emission being measured
- VBW = 3 x RBW
- Sweep = auto
- Detector function = peak
- Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the peak output power (see the NOTE above regarding external attenuation and cable loss). The limit is specified in one of the subparagraphs of this Section. Submit this plot.

The antenna port of the EUT was connected to the input of a spectrum analyzer. Power was read directly from the spectrum analyzer and cable loss correction was added to the reading to obtain the power at the antenna terminals.

4.3 Carrier Frequency Separation
FCC 15.247 (a)(1)

4.3.1 Requirement

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater.

4.3.2 Procedure

The Procedure described in the ANSI C63.10:2013 for Frequency Hopping Spread Spectrum Systems was used to determine the Carrier Frequency Separation.

- The EUT must have its hopping function enabled
- Span = wide enough to capture the peaks of two adjacent channels
- Resolution (or IF) Bandwidth (RBW) = 1% of the span
- Video (or Average) Bandwidth (VBW) = 3 x RBW
- Sweep = auto
- Detector function = peak
- Trace = max hold

Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels.

| Tested By | Test Date |
|---------------------|---------------|
| Anderson Soungpanya | June 25, 2018 |

4.3.3 Test Result

The worst case 20dB Bandwidth is 344.5 kHz, therefore the minimum Carrier Frequency Separation shall be greater than 344.5 kHz. The measured channel separation is 389.42 kHz. Carrier Frequency Separation meets the minimum requirement. Please refer to spectrum analyzer Plot 3.1 below for the test result.

Plot 3.1– Channel Separation

Date: 25.JUN.2018 12:00:26

Results **Complies**

4.4 Number of Channels
FCC 15.247 (a)(1)(iii)

4.4.1 Requirement

For frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

4.4.2 Procedure

The Procedure described in the ANSI C63.10:2013 for Frequency Hopping Spread Spectrum Systems was used to determine the Number of Channels.

- The EUT must have its hopping function enabled.
- Span = the frequency band of operation
- RBW = 1% of the span
- VBW = 3 x RBW
- Sweep = auto
- Detector function = peak
- Trace = max hold

Allow the trace to stabilize. It may prove necessary to break the span up to sections, in order to clearly show all of the hopping frequencies.

With the analyzer set to MAX HOLD, readings were taken once channels were filled in. The channel peaks were recorded and compared to the minimum number of channels required in the regulation.

| Anderson Soungpanya | June 7, 2018 |

4.4.3 Test Result

Plot 4.1 - Number of hopping channels, 900 - 915MHz

Date: 7.JUN.2018 12:44:10

4.5 Average Channel Occupancy Time
FCC 15.247(a)(1)

4.5.1 Requirement

For frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

4.5.2 Procedure

The Procedure described in the ANSI C63.10:2013 for Frequency Hopping Spread Spectrum Systems was used to determine the Average Channel Occupancy Time.

- The EUT must have its hopping function enabled.
- Span = zero span, centered on a hopping channel
- RBW = 1 MHz
- VBW = 3 x RBW
- Sweep = as necessary to capture the entire dwell time per hopping channel
- Detector function = peak
- Trace = max hold

If possible, use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation. The limit is specified in one of the subparagraphs of this Section. An oscilloscope may be used instead of a spectrum analyzer.

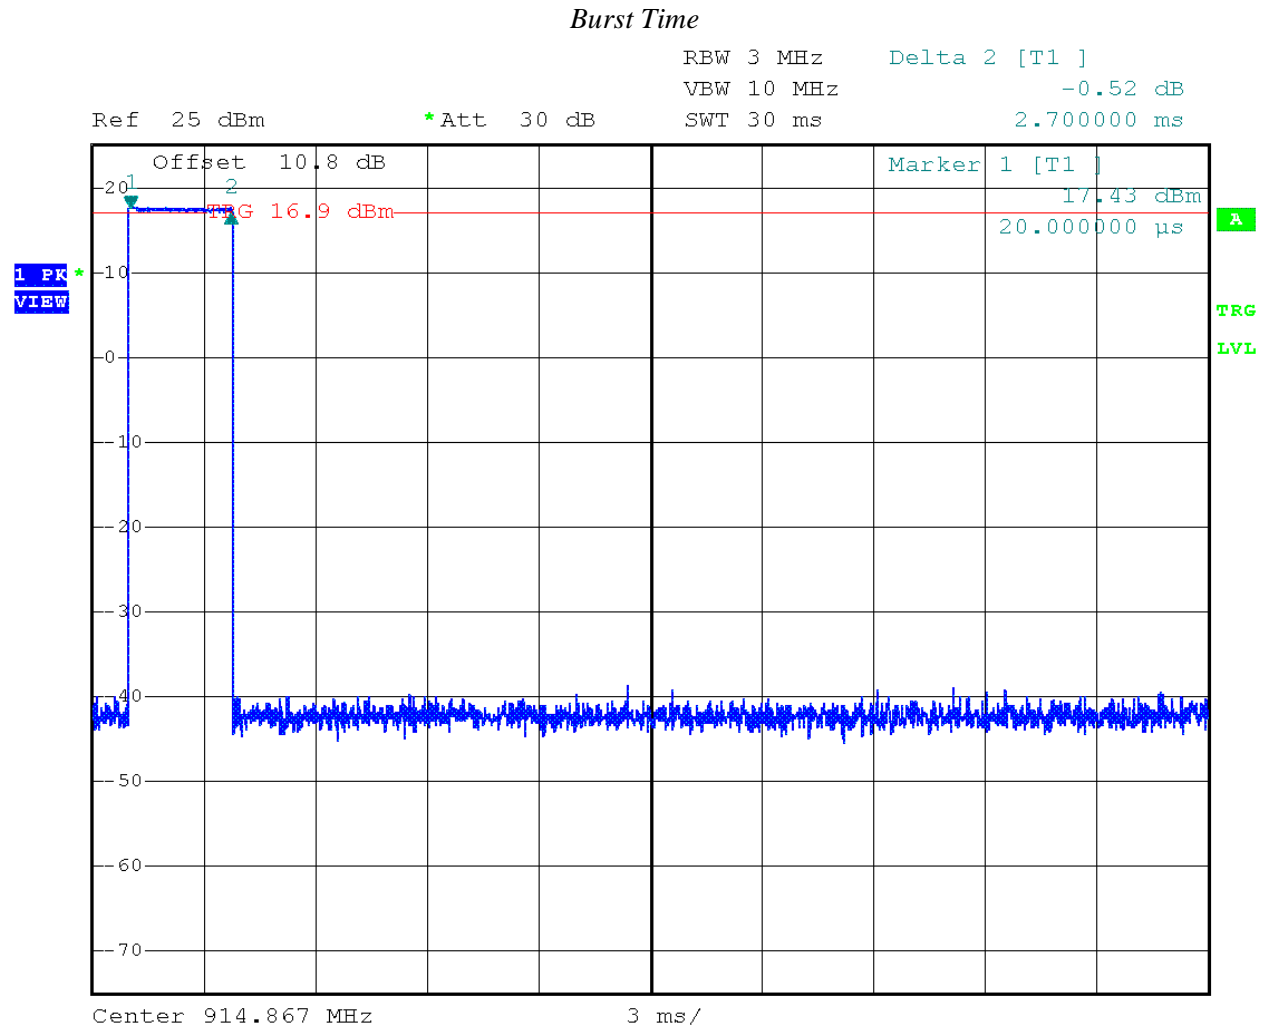

The spectrum analyzer center frequency was set to one of the known hopping channels, the SPAN was set to ZERO SPANS, and the TRIGGER was set to VIDEO. The time duration of the transmission so captured was measured with the MARKER DELTA function.

Results **Complies**

4.6 Out-of-Band Conducted Emissions
FCC 15.247(d)

4.6.1 Requirement

In any 100 kHz bandwidths outside the EUT pass-band, the RF power shall be at least 20dB (peak) or 30 dB (average) below that of the maximum in-band 100 kHz emissions.

4.6.2 Procedure

The Procedure described in the ANSI C63.10:2013 for Frequency Hopping Spread Spectrum Systems was used to determine the Out-of-Band Conducted Emissions.

- Span = wide enough to capture the peak level of the in-band emission and all spurious emissions (e.g., harmonics) from the lowest frequency generated in the EUT up through the 10th harmonic.
- RBW = 100 kHz
- VBW = 3 x RBW
- Sweep = auto
- Detector function = peak
- Trace = max hold

Allow the trace to stabilize. Set the marker on the peak of any spurious emission recorded. The level displayed must comply with the limit specified in this Section.

A spectrum analyzer was connected to the antenna port of the transmitter. Analyzer Resolution Bandwidth was set to 100 kHz. For each channel investigated, the in-band and out-of-band emission measurements were performed. The out-of-band emissions were measured from 30 MHz to 26 GHz.

| Tested By | Test Date |

4.7 Transmitter Radiated Emissions
FCC Rule 15.247(d), 15.209, 15.205

4.7.1 Requirement

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

For out of band radiated emissions (except for frequencies in restricted bands), in any 100 kHz bandwidths outside the EUT pass-band, the RF power shall be at least 20dB (peak) or 30 dB (average) below that of the maximum in-band 100 kHz emissions.

4.7.2 Procedure

Radiated emission measurements were performed from 30 MHz to 10,000 MHz. Spectrum Analyzer Resolution Bandwidth is 100 kHz or greater for frequencies 30 MHz to 1000 MHz, 1 MHz for frequencies above 1000 MHz.

The EUT is placed on a plastic turntable that is 1.5 m in height above 1 GHz and 80cm below 1GHz. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). During testing, all cables were manipulated to produce worst-case emissions. The signal is maximized through rotation. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at 10 meters for below 1GHz and at 3 meters for above 1GHz.

All measurements were made with a Peak Detector and compared to QP limits for 30MHz – 1GHz and Average or Peak limits for 1GHz – 10GHz where applicable.

Data is included of the worst-case configuration (the configuration which resulted in the highest emission levels).

EUT was tested with Antenna in place.

4.7.3 Field Strength Calculation

Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$FS = RA + AF + CF - AG$; if measurement is performed at a distance other than specified in the rule, a Distance Correction Factor (DCF) shall be added.

Where FS = Field Strength in dB(μ V/m)

RA = Receiver Amplitude (including preamplifier) in dB(μ V); AF = Antenna Factor in dB(1/m)

CF = Cable Attenuation Factor in dB; AG = Amplifier Gain in dB

Assume a receiver reading of 52.0 dB(μ V) is obtained. The antennas factor of 7.4 dB(1/m) and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving field strength of 32 dB(μ V/m). This value in dB(μ V/m) was converted to its corresponding level in μ V/m.

RA = 52.0 dB(μ V)

AF = 7.4 dB(1/m)

CF = 1.6 dB

AG = 29.0 dB

$FS = 52.0 + 7.4 + 1.6 - 29.0 = 32$ dB(μ V/m).

Level in μ V/m = Common Antilogarithm [(32 dB μ V/m)/20] = 39.8 μ V/m.

4.7.4 Test Results

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

Radiated emission measurements were performed up to 10GHz. No other emissions were detected above the noise floor which is at least 10 dB below the limit.

4.7.5 Test Setup Photographs

The following photographs show the testing configurations used.

4.7.5 Test Setup Photographs (Continued)

4.8 Digital Radiated Emissions

FCC Ref: 15.109, ICES 003

4.8.1 Requirement

Limits for Electromagnetic Radiated Emissions FCC Section 15.109(b), ICES 003*, RSS GEN

| Frequency (MHz) | Class A at 10m dB(μV/m) | Class B at 3m dB(μV/m) |
|----------------------------|------------------------------------|-----------------------------------|
| 30-88 | 39 | 40.0 |
| 88-216 | 43.5 | 43.5 |
| 216-960 | 46.4 | 46.0 |
| Above 960 | 49.5 | 54.0 |

* According to FCC Part 15.109(g) an alternative to the radiated emission limits shown above, digital devices may be shown to comply with the limit of CISPR Pub. 22

4.8.2 Procedures

Measurements are conducted with a quasi-peak detector instrument in the frequency range of 30 MHz to 1000 MHz and with the average detector instrument in the frequency range above 1000 MHz. The measuring receiver meets the requirements of Section One of CISPR 16 and the measuring antenna correlates to a balanced dipole.

Measurements of the radiated field are made with the antenna located at a distance of 10 meters from the EUT. If the field-strength measurements at 10m cannot be made because of high ambient noise level or for other reasons, measurements of Class B equipment may be made at a closer distance, for example 3m. An inverse proportionality factor of 20 dB per decade should be used to normalize the measured data or limit line to the specified distance for determining compliance.

The antenna is adjusted between 1m and 4m in height above the ground plane for maximum meter reading at each test frequency.

The antenna-to-EUT azimuth is varied during the measurement to find the maximum field-strength readings.

The antenna-to-EUT polarization (horizontal and vertical) is varied during the measurements to find the maximum field-strength readings.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for a larger EUT.

Floor standing EUT are placed on a horizontal metal ground plane and isolated from the ground plane by resting on an insulating material.

Equipment setup for radiated disturbance tests followed the guidelines of ANSI C63.4: 2014

4.8.3 Test Results

Radiated emission measurements were performed from 30 MHz to 1000 MHz. The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

An inverse proportionality factor of 20 dB per decade was used to normalize the limit line of 30MHz to 1000MHz to the specified distance for determining compliance

Note: Radiated emission measurements were performed up to 18GHz.

4.8.4 Test Configuration Photographs

4.9 AC Line Conducted Emission
FCC: 15.207, 15.107; RSS-GEN;

4.9.1 Requirement

| Frequency Band MHz | Class B Limit dB(μV) | | Class A Limit dB(μV) | |
|-----------------------|----------------------|------------|----------------------|---------|
| | Quasi-Peak | Average | Quasi-Peak | Average |
| 0.15-0.50 | 66 to 56 * | 56 to 46 * | 79 | 66 |
| 0.50-5.00 | 56 | 46 | 73 | 60 |
| 5.00-30.00 | 60 | 50 | 73 | 60 |

*Note: *Decreases linearly with the logarithm of the frequency
At the transition frequency the lower limit applies.*

4.9.2 Procedure

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification.

Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. A vertical, metal reference plane is placed 0.4m from the EUT. The vertical metal reference-plane is at least 2m by 2m. The EUT shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Floor standing EUT are placed on a horizontal metal ground plane and isolated from the ground plane by resting on an insulating material. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

Equipment setup for conducted disturbance tests followed the guidelines of ANSI C63.4:2014 and ANSI C63.10:2013.

Measurement equipment used for emission compliance testing utilized the equipment on the following list:

| Equipment Description | Manufacturer | Model/ Type | Asset No. | Monthly Cal Interval | Cal Due |
|-------------------------|-------------------|-----------------------|-----------|----------------------|----------|
| Pre-Amplifier | Sonoma Instrument | 310 | ITS 01493 | 12 | 10/20/18 |
| EMI Receiver | Rohde and Schwarz | ESR7 | ITS 01607 | 12 | 10/09/18 |
| BI-Log Antenna | Antenna Research | LPB-2513 | ITS 00355 | 12 | 02/21/19 |
| LISN | FCC | FCC-LISN-PA-NEMA-5-15 | ITS 00552 | 12 | 11/14/18 |
| RE Cable | TRU Corporation | TRU CORE 300 | ITS 1462 | 12 | 08/19/18 |
| RE Cable | TRU Corporation | TRU CORE 300 | ITS 1465 | 12 | 08/19/18 |
| RE Cable | TRU Corporation | TRU CORE 300 | ITS 1470 | 12 | 08/19/18 |
| Transient Limiter | COM-POWER | LIT-153A | ITS 1452 | 12 | 06/19/18 |
| Spectrum Analyzer | Rohde and Schwarz | FSU | ITS 00913 | 12 | 01/24/19 |
| Spectrum Analyzer | Rohde and Schwarz | FSP | ITS 01200 | 12 | 01/08/19 |
| Pre-Amplifier (1-18GHz) | Miteq | AMF-4D-001180-24-10P | ITS 00526 | 12 | 01/19/19 |
| Horn Antenna | ETS-Lindgren | 3117 | ITS 01325 | 12 | 01/25/19 |
| Horn Antenna | ETS-Lindgren | 3117-PA | ITS 01636 | 12 | 01/11/19 |
| Notch Filter | Micro-Tronics | BRC50722 | ITS 01170 | 12 | 01/26/19 |
| High Pass Filter | Reactel | THS-4/18 S11 | ITS 01171 | 12 | 01/28/19 |
| RE Cable | TRU Corporation | TRU Core 300 | ITS 01330 | 12 | 11/29/18 |
| Pre-Amplifier | Sonoma Instrument | 310 | ITS 00942 | 12 | 01/26/19 |
| Attenuator | Narda | FSCM99899 | ITS 01583 | 12 | 08/31/18 |

Software used for emission compliance testing utilized the following:

| Name | Manufacturer | Version | Template/Profile |
|--------------|----------------|-----------|---------------------------------|
| Tile | Quantum Change | 3.4.K.22 | Conducted Spurious_30M-26GHz |
| BAT-EMC | Nexio | 3.16.0.64 | Smartwires_Radio_G104059097.bpp |
| RS Commander | Rohde Schwarz | 1.6.4 | Not Applicable (Screen grabber) |
