To Whom It May Concern:

Re: Tune Up Procedure – TR-49PLUS-24N

This letter is to inform you that the TR-49PLUS-24N product family marketed by Tranzeo Wireless Technologies does not require a tune up procedure in order to ensure compliant operation in its final installation. All products are tuned and calibrated at the factory, and there are no user serviceable parts or software options that could affect the operating frequency or output power of the device.

As an 802.11a compliant device, the TR-49PLUS-24N automatically locks on to a valid base-station, and will only transmit when authorized.

For these reasons, no tune-up procedure is included with this submission for FCC certification.

The maximum output power that the device is set to during the manufacturing process is 20 dBm and the power tolerance is +/- 2 dB.

Sincerely,

A handwritten signature in blue ink that reads "Andrew Marles".
