3 SAR System and Procedures

3.1 SAR System Description

| SAR System Components |
|--|
| <ul style="list-style-type: none"> – A standard high precision 6-axis robot (Stäubli TX=RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE) – An isotropic field probe optimized and calibrated for the targeted measurement – A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC – The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server – The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts – The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning – A computer running Win7 professional operating system and the DASY5 software – Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc – The phantom, the device holder and other accessories according to the targeted measurement |

3.2 SAR System Components

| SAR Component - Robot | |
|---|--|
| <ul style="list-style-type: none"> - The DASY5 system uses the high precision robots RX90BL type out of the newer series from Stäubli SA (France) - High precision (repeatability 0.02 mm) - High reliability (industrial design) - Jerk-free straight movements - Low ELF interference (the closed metallic construction shields against motor control fields) - 6-axis controller |  |
| SAR Component - DAE | |
| <ul style="list-style-type: none"> - The data acquisition electronics (DAE3) consists of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multi-plexer, a fast 16 bit AD-converter and a command decoder and control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information as well as an optical uplink for commands and the clock - The mechanical probe mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection. The input impedance of the DAE3 is 200M Ohm; the inputs are symmetrical and floating. Common mode rejection is above 80dB |  |
| SAR Component - Probe | |
| <ul style="list-style-type: none"> - One dipole parallel, two dipoles normal to probe axis built-in shielding against static charges - Frequency Range: 10 MHz to 6 GHz - Linearity: ± 0.2dB (30MHz to 6GHz) - Directivity: <ul style="list-style-type: none"> ▪ ± 0.3 dB in HSL (rotation around probe axis) ▪ ± 0.5 dB in tissue material (rotation normal to probe axis) - Dynamic Range: 5μW/g to > 100mW/g - Dimensions: <ul style="list-style-type: none"> ▪ Overall Length: 337mm (Tip: 20mm) ▪ Tip Diameter: 2.5mm (Body: 12mm) ▪ Distance from probe tip to dipole centers: 1mm |  |

SAR Component – Twin Phantom

- Material: Vinyl ester, fiberglass reinforced (VE-GF)
- Shell Thickness: 2 ± 0.2 mm
(6 ± 0.2 mm at ear point)
- Three measurement areas:
 - Left Hand
 - Right Hand
 - Flat Phantom
- Length: 1000 mm
- Width: 500 mm
- Height: adjustable feet
- Filling Volume: approx. 25 liters

SAR Component – ELI Phantom

- Intended for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz
- Material: Vinyl ester, fiberglass reinforced (VE-GF)
- Shell thickness: 2.0 ± 0.2 mm (bottom plate)
- Major axis: 600 mm
- Minor axis: 400 mm
- Filling Volume: approx. 30 liters

SAR Component – ELI Phantom

- Is designed to cope with the different positions given in the standard
- It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points)
- The rotation centers for both scales is the ear reference point (ERP)
- Is constructed of low-loss POM material having the following dielectric parameters: relative permittivity $\epsilon=3$ and loss tangent $\delta=0.02$

SAR Component – Dipole 900 MHz – ELI Phantom

- Symmetrical dipole with $\lambda/4$ balun
- Frequency: 900 MHz
- Return Loss: >20 dB at specified validation position
- Power Capability:
 - >100 W (f <1 GHz)
 - >40 W (f >1 GHz)
- Dipole length: 148.5 mm
- Overall height: 340.0

SAR Component – Dipole 1900 MHz – ELI Phantom

- Symmetrical dipole with $\lambda/4$ balun
- Frequency: 1900 MHz
- Return Loss: >20 dB at specified validation position
- Power Capability:
 - >100 W (f <1 GHz)
 - >40 W (f >1 GHz)
- Dipole length: 67.7 mm
- Overall height: 300.0

SAR Component – SAM Twin Phantom Liquid Depth (FCC KDB 865664 D01)

– The depth of tissue-equivalent liquid in a phantom must be ≥ 15.0 cm with ≤ 0.5 cm variation for SAR measurements ≤ 3 GHz and ≥ 10.0 cm with ≤ 0.5 cm variation for measurements > 3 GHz. These depths should ensure the SAR probe is immersed sufficiently in the tissue medium while scanning along the curved surfaces of the SAM phantom at various probe angles, with an acceptable separation between the top of the zoom scan volume and the liquid-air boundary above. The required liquid depth for typical SAR measurements is determined at the ERP location of the SAM phantom and at the center of the measurement region for a flat phantom.

SAR Component – ELI Phantom Liquid Depth (FCC KDB 865664 D01)

– The depth of tissue-equivalent liquid in a phantom must be ≥ 15.0 cm with ≤ 0.5 cm variation for SAR measurements ≤ 3 GHz and ≥ 10.0 cm with ≤ 0.5 cm variation for measurements > 3 GHz. These depths should ensure the SAR probe is immersed sufficiently in the tissue medium while scanning along the curved surfaces of the SAM phantom at various probe angles, with an acceptable separation between the top of the zoom scan volume and the liquid-air boundary above. The required liquid depth for typical SAR measurements is determined at the ERP location of the SAM phantom and at the center of the measurement region for a flat phantom.

3.3 Tissue Liquid Validation

| Tissue Simulating Liquid Target Values (FCC KDB 865664 D01) | | | | |
|---|--------------|----------------|--------------|----------------|
| Target Frequency [MHz] | Head | | Body | |
| | ϵ_r | σ [S/m] | ϵ_r | σ [S/m] |
| 150 | 52.3 | 0.76 | 61.9 | 0.80 |
| 300 | 45.3 | 0.87 | 58.2 | 0.92 |
| 450 | 43.5 | 0.87 | 56.7 | 0.94 |
| 835 | 41.5 | 0.90 | 55.2 | 0.97 |
| 900 | 41.5 | 0.97 | 55.0 | 1.05 |
| 915 | 41.5 | 0.98 | 55.0 | 1.06 |
| 1450 | 40.5 | 1.20 | 54.0 | 1.30 |
| 1610 | 40.3 | 1.29 | 53.8 | 1.40 |
| 1800 – 2000 | 40.0 | 1.40 | 53.3 | 1.52 |
| 2450 | 39.2 | 1.80 | 52.7 | 1.95 |
| 3000 | 38.5 | 2.40 | 52.0 | 2.73 |
| 5800 | 35.3 | 5.27 | 48.2 | 6.00 |

Note1: Per FCC KDB 865664 D01 the dielectric parameters should be linearly interpolated between the closest pair of target frequencies to determine the applicable dielectric parameters corresponding to the device test frequency

Note 2: Per FCC KDB 865664 D01 if the deviation from the target values are within 5 to 10 % the measured SAR values must be compensated for the tissue dielectric deviations

DAK 3.5 Tissue Simulating Liquid System Components

DAK 3.5 System Tissue Validation Procedure (FCC KDB 865664 D01, IEEE 1528:2013)

1. The target frequency range is set in the measurement software
2. The DAK-System is calibrated with open termination
3. The DAK-System is calibrated with short termination using the shorting block of the system
4. The DAK-System is calibrated with load termination using distilled water
5. The Probe is put into the tissue simulating liquid inside the measurement phantom
6. The tissue simulating liquid parameters are measured over the target frequency range
7. The liquid parameters are interpolated in order to get the target parameters of the source target frequencies
8. The deviations $\Delta\epsilon_r$ and $\Delta\sigma$ of the liquid parameters from the target parameters given by the FCC and IEEE 1528:2013 in % are calculated:

$$\Delta\epsilon_r[\%] = \frac{\epsilon_r \text{ measured} - \epsilon_r \text{ target}}{\epsilon_r \text{ target}} \cdot 100$$

$$\Delta\sigma[\%] = \frac{\sigma_{\text{measured}} - \sigma_{\text{target}}}{\sigma_{\text{target}}} \cdot 100$$

9. The deviations must be $\leq 5\%$ according to FCC KDB 865664 D01 and $\leq 10\%$ for IEEE 1528:2013
10. The liquid parameters are exported from the measurement software and imported to the DASY Software

3.5 SAR System Validation

- SAR System Validation Power Setup Procedure (FCC KDB 865664 D01, IEEE 1528:2013)**
1. The power sensor PM1 is connected to the end of the feeding cable where the dipole is later connected
 2. The signal generator is set to the target frequency and the output power of the signal generator is set to a value that the power sensor PM1 shows the target system validation power (e.g. 250 mW or 100 mW)
 3. The reading of the power sensor PM2 is recorded
 4. The dipole is connected to the end of the feeding cable and placed under the phantom with the corresponding tissue simulating liquid
 5. The power level of the signal generator is readjusted until the reading of PM2 in step 3 is shown again

SAR System Validation Measurement Procedure (FCC KDB 865664 D01, IEEE 1528:2013)

Setup:

1. The system validation dipole is placed beneath the flat phantom (ELI phantom or flat phantom section of twin phantom) filled with the corresponding tissue simulating liquid of interest
2. A spacer is used to set the correct distance of the dipole from the phantom:
 - From IEEE 1528:2013: $s = 15 \text{ mm} \pm 0.2 \text{ mm}$ for $300 \text{ MHz} \leq f \leq 1000 \text{ MHz}$
 - From IEEE 1528:2013: $s = 10 \text{ mm} \pm 0.2 \text{ mm}$ for $1000 \text{ MHz} < f \leq 6000 \text{ MHz}$
3. The power setup procedure is used to set the target feed power given in the calibration documentation of the validation dipole (e.g. 250 mW or 100 mW)

Power reference Measurement:

4. At the center of the dipole area scan an initial power measurement is performed with the SAR probe in order to determine the power drift during the validation measurement

Area Scan:

5. A plane area parallel to the phantom surface is scanned using fixed grid spacing
6. The measurement values are interpolated in order to find the peak SAR location inside the area
7. The cube for the zoom scan is centred at the location of the peak SAR location

Zoom Scan:

8. The cube for the zoom scan is scanned using a fine 3 dimensional grid
9. The measurement values are interpolated and the average peak SAR value is calculated for the desired reference mass (e.g. 1-g or 10-g)

Power Drift Measurement:

10. An other power measurement is performed at the same location as for step 4
11. The power difference between step 10 and 4 is calculated
12. According to FCC KDB 865664 D01 the power drift must be $\leq \pm 5 \%$ (or $\leq \pm 0.2 \text{ dB}$) for the measurement to be valid

Deviation Analysis:

13. The measured SAR values are normalized to 1 W input power (SAR values times 4 for 250 mW or times 10 for 100 mW input power)
14. The deviation in % from the SAR values given in the calibration sheet for the dipole and tissue simulating liquid is calculated

$$\Delta SAR[\%] = \frac{SAR_{measured} - SAR_{target}}{SAR_{target}} \cdot 100$$

15. Per FCC KDB 865664 D01 the device must be $\leq \pm 10 \%$ of the target values given in the calibration document of the dipole

3.6 SAR Head Positions

| SAM Twin Phantom (IEEE 1528:2013) |
|---|
| <p>SAM Phantom</p> <ul style="list-style-type: none"> – Phantom shells for use with the test procedures in this recommended practice shall be manufactured using the CAD file of the SAM model – When used in a horizontal configuration, the SAM phantom shell is bisected along the mid-sagittal plane into right and left halves – Testing is required on both right and left sides – The perimeter sidewalls of each phantom half are extended to allow filling with liquid to a depth that is sufficient to minimize reflections from the upper surface – The liquid depth shall be measured from the ERP (inside the SAM phantom) to the air-liquid interface – shall be constructed from chemical-resistant, low-permittivity and low-loss material, with relative permittivity between 2 and 5; however, less than 2 is acceptable for frequencies up to 3 GHz – The shape of the phantom shell shall have a tolerance of less than ± 0.2 mm with respect to the SAM CAD file – In any area within the projection of the handset, the shell thickness shall be 2 mm, except for the ear and the extended perimeter walls; The tolerance on the shell thickness shall be ± 0.2 mm – In any area within the projection of the handset, the shell thickness shall be 2 mm, except for the ear and the extended perimeter walls; The tolerance on the shell thickness shall be ± 0.2 mm <p>Flat Phantom</p> <ul style="list-style-type: none"> – The minimum transverse dimensions (width and length) shall be used such that the SAR results are within 1% of a phantom with larger dimensions – For a half-wavelength dipole source, the length shall be at least 0.6 times the wavelength in air in the major dimension, and width shall be at least 0.4 times the wavelength in air in the minor dimension, with the bottom surface area larger than a corresponding ellipse – For 800 MHz to 6 GHz, the minimum dimensions of the flat phantom shall be 22.5 cm \times 15 cm in the major and minor axes, respectively – The relative permittivity of the phantom shell material shall be between 2 and 5; however, less than 2 is acceptable below 3 GHz – The loss tangent of the phantom shell material shall be less than or equal to 0.05 – The thickness of the flat phantom bottom section shall be 2 mm. The thickness shall be uniform within a tolerance of ± 0.2 mm – When filled with liquid, the sagging of the phantom directly above the source (e.g., dipole) due to the weight of the liquid shall be less than 1% of a wavelength in air in the frequency range of 800 MHz to 6 GHz, and less than 0.5% of a wavelength in air at frequencies below 800 MHz |

Ear Reference Lines (IEEE 1528:2013)

Test Positions (IEEE 1528:2013)

- two device test positions against the head phantom—the “cheek” position and the “tilt” position
- The device shall be tested in both positions on left and right sides of the SAM phantom

Cheek Position (IEEE 1528:2013)

- The N-F line is in the plane defined by the handset vertical centerline and horizontal line
- Handset touches the pinna
- The handset vertical centerline is aligned with the Reference Plane

Procedure:

1. Ready the handset for talk operation, if necessary. For example, for handsets with a flip, swivel, or slide cover piece, open the cover if this is consistent with talk operation. If the handset can transmit with the cover closed, this configuration shall be tested also
2. Define two imaginary lines on the handset—the vertical centerline and the horizontal line. The vertical centerline passes through two points on the front side of the handset—the midpoint of the width w_t of the handset at the level of the acoustic output [point A in Figure (a) and Figure (b)], and the midpoint of the width w_b at the bottom of the handset (point B). The horizontal line is perpendicular to the vertical centerline and passes through the center of the acoustic output [see Figure (a)]. The horizontal line is also tangential to the face of the handset at point A. The two lines intersect at point A.

3. Position the handset close to the surface of the phantom such that point A is on the (virtual) extension of the line passing through points RE and LE on the phantom. The plane defined by the vertical centerline and the horizontal line of the handset is parallel to the sagittal plane of the phantom

4. Translate the handset towards the phantom along the line passing through RE and LE until the handset touches the pinna

5. Rotate the handset around the (virtual) LE-RE line until the handset vertical centerline is in the Reference Plane

6. Rotate the handset around the vertical centerline until the plane defined by the handset vertical centerline and horizontal line is parallel to the N-F line, and translate the handset along the LE-RE line toward the phantom until handset touches the pinna

7. While keeping point A on the line passing through RE and LE, and maintaining the handset in contact with the pinna at the ERP, rotate the handset about the N-F line until any point on the handset is in contact with a phantom point below the pinna on the cheek

8. While keeping the handset in contact with the pinna, rotate the handset around a line perpendicular to the plane defined by the handset vertical centerline and horizontal line and passing through handset point A, until the handset vertical centerline is in the Reference Plane. Note that this step is necessary, as the handset may not be in the reference plane after step 7)

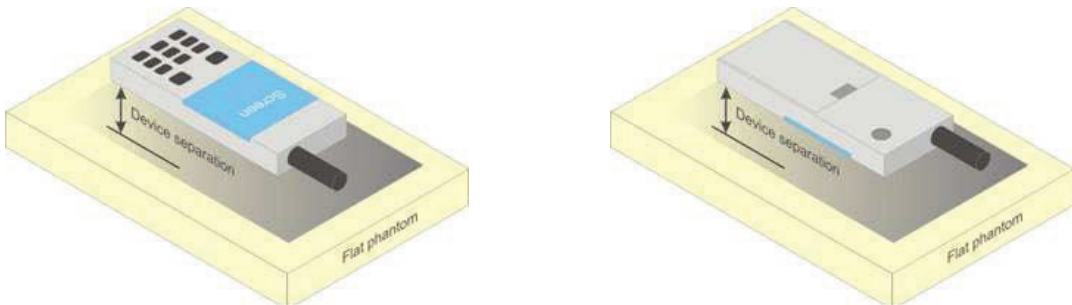

Tilt Position (IEEE 1528:2013)

Procedure:

1. Repeat the steps for the cheek position to place the device in the cheek position
2. While maintaining the orientation of the handset, move the handset away from the pinna along the line passing through RE and LE far enough to allow a rotation of the handset away from the cheek by 15°
3. Rotate the handset around the horizontal line by 15°
4. While maintaining the orientation of the handset, move the handset towards the phantom on the line passing through RE and LE until any part of the handset touches the ear. The tilt position is obtained when the contact point is on the pinna. If contact occurs at any location other than the pinna, e.g., the antenna at the back of the phantom head, the angle of the handset shall be reduced. In this case, the tilt position is obtained if any point on the handset is in contact with the pinna and a second point on the handset is in contact with the phantom, e.g., the antenna with the back of the head

3.7 SAR Body Positions

| Body-worn Positions (FCC KDB 447498 D01) |
|---|
| <ul style="list-style-type: none"> – Devices that support transmission while used with body-worn accessories must be tested for body worn accessory SAR compliance – Body SAR compliance is also tested with a flat phantom – SAR evaluation is required for body-worn accessories supplied with the host device – All body-worn accessories containing metallic components, either supplied with the product or available as an option from the device manufacturer, must be tested in conjunction with the host device to demonstrate compliance – Body-worn accessory SAR compliance must be based on a single minimum test separation distance for all wireless and operating modes applicable to each body-worn accessory used by the host, and according to the relevant voice and/or data mode transmissions and operations – A conservative minimum test separation distance for supporting off-the-shelf body-worn accessories that may be acquired by users of consumer handsets should be used to test for body-worn accessory SAR compliance – This distance is determined by the handset manufacturer according to the typical body-worn accessories users may acquire at the time of equipment certification, but not more than 2.5 cm, to enable users to purchase aftermarket body-worn accessories with the required minimum separation – The selected test separation distance must be clearly explained in the SAR report to support the body-worn accessory test configurations – Devices that are designed to operate on the body of users using lanyards and straps or without requiring additional body-worn accessories must be tested for SAR compliance using a conservative minimum test separation distance ≤ 5 mm to support compliance |
|  |

3.8 SAR Measurement Procedure

| Step 1: Power Reference Measurement (FCC KDB 865664 D01, IEEE 1528:2013) |
|--|
| <ol style="list-style-type: none"> 1. The probe is positioned at the closest distance to the surface of the phantom 2. A power measurement is performed as later reference for the second power drift measurement at the same position |

| Step 2: Area Scan (FCC KDB 865664 D01, IEEE 1528:2013) | | |
|--|--|---|
| <ol style="list-style-type: none"> 1. An area larger than all radiating structures and antennas of the equipment under test is defined 2. The grid spacing and distance to the phantom surface is selected according to the requirements given in FCC KDB 865664 D01 | | |
| | ≤ 3 GHz | > 3 GHz |
| Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface | 5 mm \pm 1 mm | $\frac{1}{2} \cdot \delta \cdot \ln(2)$ mm \pm 0.5 mm |
| Maximum probe angle from probe axis to phantom surface normal at the measurement location | $30^\circ \pm 1^\circ$ | $20^\circ \pm 1^\circ$ |
| Maximum area scan spatial resolution: Δx_{Area} , Δy_{Area} | ≤ 2 GHz: ≤ 15 mm 2 – 3 GHz: ≤ 12 mm | 3 – 4 GHz: ≤ 12 mm 4 – 6 GHz: ≤ 10 mm |
| | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be \leq the corresponding x or y dimension of the test device with at least one measurement point on the test device. | |
| Settings applied: for frequencies < 3 GHz: $\Delta x = \Delta y = 10$ mm; $\Delta z = 4$ mm (Note 1) | | |
| Settings applied: for frequencies > 3 GHz: $\Delta x = \Delta y = 5$ mm; $\Delta z = 2$ mm (Note 2) | | |
| <ol style="list-style-type: none"> 3. At each grid point a measurement is performed until all points of the grid are measured 4. The values are interpolated and the location of the peak SAR value is determined 5. If a location closer than $\frac{1}{2}$ the zoom scan volume to the edges is determined, the area is extended | | |
| Note 1: According the DASY 5.2 Manual a distance of the Probe Sensor to the Phantom Surface should be between 4 mm up to 3 GHz | | |
| Note 2: According the DASY 5.2 Manual a distance of the Probe Sensor to the Phantom Surface should be between 1.5 and 2.0 mm above 3 GHz | | |

| $\frac{1}{2} \cdot \delta \cdot \ln(2)$ (IEEE 1528:2013) | |
|--|--|
| Frequency [MHz] | $\frac{1}{2} \cdot \delta \cdot \ln(2)$ [mm] |
| 3000 | 4.8 |
| 4000 | 3.3 |
| 5000 | 2.5 |
| 5200 | 2.4 |
| 5400 | 2.3 |
| 5600 | 2.2 |
| 5800 | 2.1 |
| 6000 | 2.0 |

Note 1: According the DASY 5.2 Manual a distance of the Probe Sensor to the Phantom Surface should be between 1.5 and 2.0 mm

Step 3: Zoom Scan (FCC KDB 865664 D01, IEEE 1528:2013)

1. The zoom scan is initially performed at the location of the highest peak SAR in the area scan
2. For the zoom scan a 3d cube is used with grid settings as required from FCC KDB 865664 D01:

| | | ≤ 3 GHz | > 3 GHz |
|--|------------------------------------|--|---|
| Maximum zoom scan spatial resolution: $\Delta x_{Zoom}, \Delta y_{Zoom}$ | | ≤ 2 GHz: ≤ 8 mm $2 - 3$ GHz: ≤ 5 mm* | $3 - 4$ GHz: ≤ 5 mm* $4 - 6$ GHz: ≤ 4 mm* |
| Maximum zoom scan spatial resolution, normal to phantom surface | uniform grid: $\Delta z_{Zoom}(n)$ | ≤ 5 mm | $3 - 4$ GHz: ≤ 4 mm $4 - 5$ GHz: ≤ 3 mm $5 - 6$ GHz: ≤ 2 mm |
| | graded grid | $\Delta z_{Zoom}(1)$: between 1 st two points closest to phantom surface | ≤ 4 mm |
| | | $\Delta z_{Zoom}(n>1)$: between subsequent points | $\leq 1.5 \cdot \Delta z_{Zoom}(n-1)$ mm |
| Minimum zoom scan volume | x, y, z | ≥ 30 mm | $3 - 4$ GHz: ≥ 28 mm $4 - 5$ GHz: ≥ 25 mm $5 - 6$ GHz: ≥ 22 mm |
| Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium; see IEEE Std 1528-2013 for details. * When zoom scan is required and the <i>reported</i> SAR from the <i>area scan based 1-g SAR estimation</i> procedures of KDB Publication 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz. | | | |

Settings applied: for frequencies < 3 GHz: $\Delta x = \Delta y = \Delta z = 5$ mm; volume x,y,z = 30 mm

Settings applied: for frequencies > 3 GHz: $\Delta x = \Delta y = \Delta z = 2$ mm; volume x,y,z = 30 mm

3. The measured field strength values are interpolated and the average SAR value is calculated
4. When the 1-g SAR is within 2 dB of the SAR limit, additional zoom scans are performed for other peaks within 2 dB of the highest SAR peak
5. The determined 1-g and 10-g average SAR values are recorded for all determined SAR locations

Step 4: Power Drift Measurement (FCC KDB 865664 D01, IEEE 1528:2013)

1. At the same location as in step 1 the power measurement is repeated
2. The power drift is calculated from the values measured in step 4 (M_{step4}) and step 1 (M_{step1}) as

$$\text{Deviation} = M_{step4} / M_{step1}$$
3. The drift in % is calculated as

$$10 \cdot \log_{10}(\text{Deviation}) \text{ [dB]}$$
4. The drift shall be $\leq \pm 5 \%$ or $\leq 10 \cdot \log_{10}(1.05) = 0.2$ dB or $\leq 10 \cdot \log_{10}(0.95) = -0.2$ dB

3.9 SAR Equipment List

4 General Evaluation Guidance and Procedures

4.1 SAR Limits

| Exposure Environments (FCC and ISED) | |
|---|--|
| General Population/ Uncontrolled Environment | Defined as locations where there is the exposure of individuals who has no knowledge or control of their exposure |
| Occupational/ Controlled Environment | Defined as locations where there is exposure that may be incurred by persons who are aware of the potential for exposure |

| SAR Limits (FCC and ISED) | | |
|---|--------------------|--------------|
| Exposure Condition | General Population | Occupational |
| Spatial Peak SAR (1-g) (Brain/Body/Arms/Legs) | 1.60 W/kg | 8.00 W/kg |
| Spatial Average SAR (Whole Body) | 0.08 W/kg | 0.40 W/kg |
| Spatial Peak SAR (10-g) (Hands/Feet/Ankle/Wrist) | 4.00 W/kg | 20.00 W/kg |

4.2 SAR Evaluation for Head

| SAR Evaluation for Head (FCC KDB 447498 D01) |
|--|
| <ul style="list-style-type: none"> – Devices that are designed to transmit next to the ear and operate according to the handset procedures in IEEE Std 1528-2013, or conditions described in the published RF exposure KDB procedures, must be tested using the SAM phantom defined in IEEE Std 1528-2013 – When antennas are near the bottom of a handset and the peak SAR location is located in regions of the SAM phantom where SAR probe access can be limited, the procedures in KDB Publication 648474 D04 must be applied – Other head exposure conditions, for example, in-front-of the face, should be tested using a flat phantom according to the required published RF exposure KDB procedures |

4.3 SAR Evaluation for body-worn accessory

| SAR Evaluation for body-worn accessory (FCC KDB 447498 D01) |
|--|
| <ul style="list-style-type: none"> – Body SAR compliance is also tested with a flat phantom – For devices with irregular shapes or form factors that do not conform to a flat phantom, and/or unusual operating configurations and exposure conditions, a KDB inquiry is also required to determine the appropriate SAR measurement procedures <p>Devices</p> <ul style="list-style-type: none"> – Devices that support transmission while used with body-worn accessories must be tested for bodyworn accessory SAR compliance <p>Accessories</p> <ul style="list-style-type: none"> – All body-worn accessories containing metallic components, either supplied with the product or available as an option from the device manufacturer, must be tested in conjunction with the host device to demonstrate compliance – Body-worn accessories that do not contain metallic or conductive components may be tested according to worst-case exposure configurations, typically according to the smallest test separation distance required for the group of body-worn accessories with similar operating and exposure characteristics – Body-worn accessory SAR compliance must be based on a single minimum test separation distance for all wireless and operating modes applicable to each body-worn accessory used by the host, and according to the relevant voice and/or data mode transmissions and operations – If a body-worn accessory supports voice only operations in its normal and expected use conditions (for example, beltclips and holsters for cellphones), testing of data mode for body-worn compliance is not required |

- A conservative minimum test separation distance for supporting off-the-shelf body-worn accessories that may be acquired by users of consumer handsets should be used to test for body-worn accessory
 - This distance is determined by the handset manufacturer according to the typical body-worn accessories users may acquire at the time of equipment certification, but not more than 2.5 cm
 - The selected test separation distance must be clearly explained in the SAR report to support the body-worn accessory test configurations
- Devices that are designed to operate on the body of users using lanyards and straps or without requiring additional body-worn accessories must be tested for SAR compliance using a conservative minimum test separation distance ≤ 5 mm to support compliance
- Users must be fully informed of the operating requirements and restrictions, to the extent that the typical user can easily understand the information, to acquire the required body-worn accessories to maintain compliance

4.4 SAR Evaluation for Extremities

| SAR Evaluation for Extremities (FCC KDB 447498 D01) |
|---|
| <ul style="list-style-type: none"> – Devices that are designed or intended for use on extremities, or mainly operated in extremity only exposure conditions, i.e., hands, wrists, feet and ankles, may require extremity SAR evaluation – When extremity SAR testing is required, a flat phantom must be used if the exposure condition is more conservative than the actual use conditions <ul style="list-style-type: none"> otherwise, a KDB inquiry is required to determine the phantom and test requirements – When the device also operates in close proximity to the user’s body, SAR compliance for the body is also required – The 1-g body and 10-g extremity SAR Test Exclusion Thresholds should be applied to determine SAR test requirements – For devices with irregular shapes or form factors that do not conform to a flat phantom, and/or unusual operating configurations and exposure conditions, a KDB inquiry is also required to determine the appropriate SAR measurement procedures – when simultaneous transmission applies to extremity exposure, the simultaneous transmission SAR test exclusion provisions should be applied – When simultaneous transmission SAR measurement is required, the enlarged zoom scan and volume scan post-processing procedures in KDB Publication 865664 D01 should be applied |

4.5 Required test channels

| Required SAR Test Channels (FCC KDB 447498 D01) |
|---|
| <p>When the frequency channels required for SAR testing are not specified in the published RF exposure KDB procedures, the following should be applied to determine the number of required test channels:</p> $N_c = \text{Round} \left[\sqrt{100 \cdot \frac{f_{high} - f_{low}}{f_c}} \cdot \left(\frac{f_c}{100} \right)^{0.2} \right]$ <p>where:</p> <ul style="list-style-type: none"> N_c: number of test channels, rounded to the nearest integer f_{high}: highest channel frequencies within the transmission band in MHz f_{low}: lowest channel frequencies within the transmission band in MHz f_c: mid-band channel frequency in MHz |

4.6 Maximum output power and tune-up tolerance

| Maximum rated output power and tune-up tolerance (FCC KDB 447498 D01) |
|--|
| <ul style="list-style-type: none"> – The maximum output power and tolerance allowed for production units should be used to determine RF exposure test exclusion and compliance – Each device must be evaluated for SAR compliance in the required operating modes and test configurations, at the maximum rated output power and within the tune-up tolerance range specified for the product – SAR evaluation must be performed at power level not more than 2 dB lower than the maximum tune-up tolerance limit – The range of expected maximum output power variations from the rated nominal maximum output power specified for the product or wireless mode is referred to as the tune-up tolerance in this document. All devices must be tested within the tune-up tolerance specification range |

| Maximum source-based time-averaged conducted output power (KDB 865664 D01, TCB Council 2016-10) |
|--|
| <ul style="list-style-type: none"> – RF exposure compliance must be determined at the maximum average power level according to source-based time-averaging requirements – Time-averaged maximum conducted output power applies to SAR – When SAR evaluation is required to determine compliance, the duty factor established in the SAR analysis may be applied to scale the measured SAR |

4.7 Reported SAR

| Reported SAR according (FCC KDB 447498 D01) |
|--|
| <p>Measured SAR values must be scales to the maximum tune-up tolerance limit. The results are referred to as reported SAR values:</p> $SAR_{Reported} \left[\frac{W}{kg} \right] = SAR_{Measured} \left[\frac{W}{kg} \right] \cdot \frac{Power_{Maximum \text{ including tune-up tolerance}} [mW]}{Power_{Actual \text{ for measurement}} [mW]}$ |

| Reported SAR Duty Factor Scaling (FCC KDB 248227 D01) |
|--|
| <p>The reported SAR values must be scales to the maximum duty factor specified for production units. The results are referred to as scaled reported SAR values:</p> $SAR_{Reported \text{ scaled}} \left[\frac{W}{kg} \right] = SAR_{Reported} \left[\frac{W}{kg} \right] \cdot \frac{1}{Duty \text{ Factor}}$ |

4.8 Standalone SAR Test Exclusion

| Standalone SAR test exclusion (FCC KDB 447498 D01) | |
|---|---|
| Input: | |
| 1. P: Source-based time-averaged maximum conducted output power of RF channel requiring evaluation | |
| 2. d: Minimum test separation distance required for exposure conditions (Note 1, 2) | |
| 3. f: RF channel frequency | |
| Test exclusion power level calculation: | |
| 1. Frequency 100 MHz to 6 GHz, Test separation distance ≤ 50 mm: | |
| 1-g SAR: | $P[mW] = 3.0 \cdot \frac{d[mm]}{\sqrt{f[GHz]}}$ |
| 10-g SAR: | $P[mW] = 7.5 \cdot \frac{d[mm]}{\sqrt{f[GHz]}}$ |
| When test separation distance is < 5 mm, a distance of 5 mm is applied to determine test exclusion | |
| 2. Frequency 100 MHz to 6 GHz, Test separation distance > 50 mm: | |
| 1-g SAR: (100 – 1500 MHz) | $P[mW] = \left(3.0 \cdot \frac{50 \text{ mm}}{\sqrt{f[GHz]}} \right) + \left[(d[mm] - 50 \text{ mm}) \cdot \frac{f[MHz]}{150} \right]$ |
| 1-g SAR: ($> 1500 - 6000$ MHz) | $P[mW] = \left(3.0 \cdot \frac{50 \text{ mm}}{\sqrt{f[GHz]}} \right) + [(d[mm] - 50 \text{ mm}) \cdot 10]$ |
| 10-g SAR: (100 – 1500 MHz) | $P[mW] = \left(7.5 \cdot \frac{50 \text{ mm}}{\sqrt{f[GHz]}} \right) + \left[(d[mm] - 50 \text{ mm}) \cdot \frac{f[MHz]}{150} \right]$ |
| 10-g SAR: ($> 1500 - 6000$ MHz) | $P[mW] = \left(7.5 \cdot \frac{50 \text{ mm}}{\sqrt{f[GHz]}} \right) + [(d[mm] - 50 \text{ mm}) \cdot 10]$ |
| 3. Frequency < 100 MHz: | |
| 1-g SAR: (> 50 and < 200 mm) | $P[mW] = \left\{ \left(3.0 \cdot \frac{50 \text{ mm}}{\sqrt{0.1}} \right) + \left[(d[mm] - 50 \text{ mm}) \cdot \frac{100}{150} \right] \right\} \cdot \left[1 + \log \left(\frac{100}{f[MHz]} \right) \right]$ |
| 1-g SAR: (≤ 50 mm) | $P[mW] = \left\{ \left(3.0 \cdot \frac{50 \text{ mm}}{\sqrt{0.1}} \right) + \left[(d[mm] - 50 \text{ mm}) \cdot \frac{100}{150} \right] \right\} \cdot \left[1 + \log \left(\frac{100}{f[MHz]} \right) \right] \cdot \frac{1}{2}$ |
| 10-g SAR: (> 50 and < 200 mm) | $P[mW] = \left\{ \left(7.5 \cdot \frac{50 \text{ mm}}{\sqrt{0.1}} \right) + \left[(d[mm] - 50 \text{ mm}) \cdot \frac{100}{150} \right] \right\} \cdot \left[1 + \log \left(\frac{100}{f[MHz]} \right) \right]$ |
| 10-g SAR: (≤ 50 mm) | $P[mW] = \left\{ \left(7.5 \cdot \frac{50 \text{ mm}}{\sqrt{0.1}} \right) + \left[(d[mm] - 50 \text{ mm}) \cdot \frac{100}{150} \right] \right\} \cdot \left[1 + \log \left(\frac{100}{f[MHz]} \right) \right] \cdot \frac{1}{2}$ |
| 4. If the source-based time-averaged maximum conducted output power is lower or equal than the test exclusion power level no SAR testing will be required | |
| Note 1: Minimum test separation distance is determined by the smallest distance from the antenna and radiating structures or outer surface of the device, according to the host form factor, exposure conditions and platform requirements, to any part of the body or extremity of a user or bystander | |
| Note 2: To qualify for SAR test exclusion, the test separation distances applied must be fully explained and justified, typically in the SAR measurement or SAR analysis report, by the operating configurations and exposure conditions of the transmitter and applicable host platform requirements, according to the required published RF exposure KDB procedures | |

| Standalone SAR test exclusion (ISED RSS-102) | |
|---|--|
| Input: | |
| <ol style="list-style-type: none"> 1. Output power level; shall be the higher of the maximum conducted or equivalent isotropically radiated power (e.i.r.p.) source-based, time-averaged output power 2. Minimum test separation distance D required for exposure conditions (Note) 3. RF channel frequency | |
| Test exclusion power level calculation: | |
| <ol style="list-style-type: none"> 1. Use linear interpolation of frequency and Separation distance in order to determine the exemption power level that applies to the test frequency and distance 2. If the output power level of the device is lower or equal than the exemption power level no SAR testing will be required | |
| Note: When test separation distance is < 5 mm, a distance of 5 mm is applied to determine test exclusion | |

| Exemption Power Limits [mW] (ISED RSS-102) | | | | | | | | | | |
|--|--------------------------|-----|-----|-----|-----|-----|-----|-----|-----|------|

Note: For limb-worn devices where the 10 gram value applies, the exemption limits for routine evaluation in the Table are multiplied by a factor of 2.5

4.9 SAR Value Estimation

| Estimated SAR (FCC KDB 447498 D01) | |
|---|--|
| Input: | |
| <ol style="list-style-type: none"> 1. P: Source-based time-averaged maximum conducted output power of RF channel requiring evaluation 2. d: Minimum test separation distance required for exposure conditions (Note) 3. f: RF channel frequency | |
| Estimated SAR calculation: | |
| 1. Test separation distance ≤ 50 mm: | |
| 1-g SAR: $SAR_{Estimated} \left[\frac{W}{kg} \right] = \frac{P[mW]}{d[mm]} \cdot \frac{\sqrt{f[GHz]}}{7.5}$ | |
| 10-g SAR: $SAR_{Estimated} \left[\frac{W}{kg} \right] = \frac{P[mW]}{d[mm]} \cdot \frac{\sqrt{f[GHz]}}{18.75}$ | |
| 2. Test separation distance > 50 mm: | |
| 1-g SAR: $SAR_{Estimated} \left[\frac{W}{kg} \right] = 0.4$ | |
| 10-g SAR: $SAR_{Estimated} \left[\frac{W}{kg} \right] = 1.0$ | |
| Note: Minimum test separation distance is determined by the smallest distance from the antenna and radiating structures or outer surface of the device, according to the host form factor, exposure conditions and platform requirements, to any part of the body or extremity of a user or bystander | |

4.10 Simultaneous SAR Test Exclusion

| Simultaneous Transmitter SAR test exclusion (FCC KDB 447498 D01) |
|--|
| <p>Method 1 – Sum of SAR:</p> <ol style="list-style-type: none"> The SAR values from the simultaneous transmitting radios are selected If an excluded radio transmitter participates in the multi-transmitter mode, the SAR value must be estimated The reported SAR values from the simultaneous transmitting radios are added If the sum of SAR values is below the limit no further SAR testing is required <p>Method 2 – SAR to Peak Location Separation Ratio (SPLSR)</p> <ol style="list-style-type: none"> The SAR values from the simultaneous transmitting radios are selected If an excluded radio transmitter participates in the multi-transmitter mode, the SAR value must be estimated From the various transmitters participating in the multi-transmitter mode, all pairs of two transmitters are evaluated (e.g. for three simultaneous transmitters = 1 and 2, 2 and 3, 1 and 3) For the transmitter pair under evaluation the location of the hotspot is determined Measured SAR: The location of the hotspot as given in the SAR measurement results Estimated SAR: The center of the transmitter antenna With the two reported SAR values SAR_1 and SAR_2 and the separation distance r the SPLSR is calculated: $SPLSR = \frac{\sqrt{(SAR_1 + SAR_2)^3}}{R}$ If the result is below the exclusion value the pair is excluded 1-g SAR: $SPLSR \leq 0.04$ 10-g SAR: $SPLSR \leq 0.10$ All antenna pair that do not qualify for test exclusion must be tested |

4.11 General SAR Test Reduction

| General SAR test reduction (FCC KDB 447498 D01) |
|---|
| <ol style="list-style-type: none"> SAR is measured for the mid-band or highest output power channel Testing of the other required channels within the operating mode of a frequency band is not required if the the reported 1-g or 10-g SAR of the test channel in step 1 is: $\begin{array}{l} \text{1-g SAR} \\ (\text{Band} \leq 100 \text{ MHz}) \end{array} \quad SAR_{\text{Reported}} \leq 0.8 \frac{W}{kg}$ $\begin{array}{l} \text{1-g SAR} \\ (100 \text{ MHz} < \text{Band} < 200 \text{ MHz}) \end{array} \quad SAR_{\text{Reported}} \leq 0.6 \frac{W}{kg}$ $\begin{array}{l} \text{1-g SAR} \\ (\text{Band} \geq 200 \text{ MHz}) \end{array} \quad SAR_{\text{Reported}} \leq 0.4 \frac{W}{kg}$ $\begin{array}{l} \text{10-g SAR} \\ (\text{Band} \leq 100 \text{ MHz}) \end{array} \quad SAR_{\text{Reported}} \leq 2.0 \frac{W}{kg}$ $\begin{array}{l} \text{10-g SAR} \\ (100 \text{ MHz} < \text{Band} < 200 \text{ MHz}) \end{array} \quad SAR_{\text{Reported}} \leq 1.5 \frac{W}{kg}$ $\begin{array}{l} \text{10-g SAR} \\ (\text{Band} \geq 200 \text{ MHz}) \end{array} \quad SAR_{\text{Reported}} \leq 1.0 \frac{W}{kg}$ |

4.12 SAR Measurement Variability

| SAR Measurement Variability (FCC KDB 865664 D01) |
|---|
| <ul style="list-style-type: none"> – Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg – When the original highest measured SAR is ≥ 0.80 W/kg, repeat that measurement once – Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/kg – Perform a third repeated measurement only if the original, first or second repeated measurement is ≥ 1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20 – The same procedures should be adapted for measurements according to extremity and occupational exposure limits by applying a factor of 2.5 for extremity exposure and a factor of 5 for occupational exposure to the corresponding SAR thresholds |
| <p>Procedure:</p> <ol style="list-style-type: none"> 1. Additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band 2. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged 3. The device is re-mounted on the device holder for the repeated measurement(s) using the same measurement settings and configuration as for the initial SAR measurement |

4.13 SAR Measurement Uncertainty

| SAR Measurement Uncertainty (FCC KDB 865664 D01) |
|--|
| <ul style="list-style-type: none"> – When the highest measured 1-g SAR within a frequency band is < 1.5 W/kg, the extensive SAR measurement uncertainty analysis described in IEEE Std 1528-2013 is not required in SAR reports submitted for equipment approval – SAR measurement uncertainty analysis is required in SAR reports only when the highest measured SAR in a frequency band is ≥ 1.5 W/kg for 1-g SAR – The procedures described in IEEE Std 1528-2013 should be applied – The expanded SAR measurement uncertainty must be $\leq 30\%$, for a confidence interval of $k = 2$ |

4.14 SAR DUT Holder Perturbations

| SAR DUT Holder Perturbations (FCC TCB Council 2016-10) |
|--|
| <ul style="list-style-type: none"> – When the highest reported SAR of an antenna is > 1.2 W/kg (1-g) or 3.0 (10-g), holder perturbation verification is required for each antenna, using the highest SAR configuration among all applicable frequency bands – in the same exact device and holder positions used for head and body SAR measurements; i.e. same device/button locations in the holder – a KDB inquiry is required if the highest reported SAR for each antenna, adjusted for increases in holder perturbation, would introduce noncompliance conditions or noticeably high differences due to perturbation |
| <p>Procedure:</p> <ol style="list-style-type: none"> 1. For each frequency band and exposure condition the highest reported SAR is determined for each antenna 2. If the reported SAR is above the threshold value the procedure given in E.4.1.1 of IEEE 1528:2013 is followed for holder perturbation analysis 3. The SAR tolerance is calculated $SAR_{tolerance} [\%] = \frac{SAR_{with\ holder} - SAR_{without\ holder}}{SAR_{with\ holder}} \cdot 100$ 4. If the SAR tolerance is negative which means that the SAR value without DUT holder is larger than the SAR value with DUT holder, the reported SAR value is corrected by the SAR tolerance in order to take the decrease in SAR value because of the DUT holder into account. $SAR_{Reported\ with\ DUT\ holder\ perturbations} \left[\frac{W}{kg} \right] = SAR_{Reported} \left[\frac{W}{kg} \right] \cdot \left(1 - \frac{SAR_{tolerance} [\%]}{100} \right)$ |

4.15 SAR Reporting

| General RF-Exposure Reporting Requirements (FCC KDB 865664 D02) |
|--|
| <ul style="list-style-type: none"> – The operating modes and exposure conditions of all wireless technologies applicable to the equipment approval must be clearly described <ol style="list-style-type: none"> 1. Nominal and maximum output power of all wireless modes and frequency bands of production units should be specified; Tune-up tolerances should also be included when it is required for equipment authorization otherwise, the maximum power allowed for production units should be identified. When multiple maximum output power levels are specified for a wireless or operating mode; for example, different time slots, data rates or modulation requirements, such as GPRS, EDGE, 802.11, WiMax and various 3GPP implementations, the maximum output power of each configuration should be identified separately 2. Antenna dimensions and separation distances should be illustrated in photos and/or diagrams 3. Voice and data mode transmission requirements in all supported operating configurations and exposure conditions for standalone and simultaneous transmission operations 4. Device implementation and operating requirements that can influence the RF exposure evaluation; for example, MPR, testing duty factor for TDD systems, power reduction requirements and multiple transmission configurations, such as data rate, data mode, channel bandwidth and modulation etc 5. Accessories supplied with the device or available as options from the device manufacturer or provisions for supporting other after-market accessories that can influence the RF exposure evaluation 6. Accessories supplied with the device or available as options from the device manufacturer or provisions for supporting other after-market accessories that can influence the RF exposure evaluation 7. Optional antennas – The device test setup and operating configurations used to establish transmission in various wireless modes should be documented; the information should include at least the following <ol style="list-style-type: none"> 1. The test setup, measurement, numerical simulation or analysis procedures and KDB numbers of published RF exposure KDB procedures applied to test the device, include latest applicable TCB workshop guidance, 2. Test guidance and other considerations provided through specific KDB inquiries to manufacturers and test labs should be fully described in test reports to support the test results. KDB tracking numbers should not be identified in test reports 3. Source-based time-averaging duty factors that are inherent to device transmissions or applied separately to the measured results must be clearly explained in the test reports 4. When test reduction and exclusion are applied, justifications according to the published RF exposure KDB procedures or KDB inquiries are required 5. Except for generic test setup photos, other diagrams and illustrations should include proper explanations and descriptions to support the test setup and measurement results 6. The test and supporting equipment or numerical simulation tools used to test the device should be uniquely identified in test reports, including actual calibration dates, required calibration interval and calibration status or software release versions. Equipment and apparatuses that are not used in the tests, except when clearly noted, should not be listed |

| SAR Reporting Requirements (FCC KDB 865664 D02) |
|---|
| <ul style="list-style-type: none"> – SAR system validation status and system verification results should be documented in a separate section of the SAR report, or as an attachment, to confirm measurement accuracy – Conducted output power measurements are required to support the SAR results and for scaling results to the maximum tune-up tolerance or production limit – When multiple maximum output power levels are applied to different transmission configurations; for example, due to time slot, data rate, transmission protocol or signal modulation requirements, such as GMSK vs. 8-PSK in EDGE and different MPR or RB configurations in WCDMA or LTE, separate maximum output power measurements are required to support the SAR test configurations and results – When power reduction is implemented, the maximum output power levels and triggering conditions for activating the power reduction and returning to normal full power conditions must be verified and reported according to published RF exposure KDB procedures or procedures determined through KDB inquiries |

- The measured SAR results should be tabulated separately according to the test configurations documented in the test setup descriptions section of the test report, for the required test positions such as head, body-worn accessories, other use conditions (e.g. hotspot mode) and other host device specific exposure configurations
- Information relating to duty factors, TDMA time-slots and maximum output power of the various operating modes and conditions are also required to support the SAR results
- When SAR scaling is required to determine compliance for duty factors that are neither source-based nor inherent to the measurements, the scaling procedures and scaled results should be included after the tabulated SAR summary
- If the same scaling factor is applied to a group of SAR results; for example, a frequency band or operating mode, scaling the highest measured SAR within the group should generally be sufficient to demonstrate compliance
- The SAR scaling procedures required by the published RF exposure KDB procedures, specific KDB inquiries or other FCC requirements must be correctly applied to qualify for equipment approval
- When required, the SAR measurement variability and measurement uncertainty analysis results should be included after the tabulated SAR summary, according to procedures in KDB Publication 865664 D01. It should be clearly explained in the test report when SAR measurement uncertainty analysis is not required, but included for other purposes
- The analysis required to qualify for simultaneous transmission SAR test exclusion should be documented separately according to the head, body-worn accessory, other use conditions and host specific configurations described in the test setup section of the SAR report
- When applying SAR peak location separation ratio test exclusion, the peak location coordinates of each test configuration must be identified according to procedures in KDB Publication 447498 D01. The measured and estimated peak locations must be clearly identified, on SAR plots and illustrations as appropriate, to support the test exclusion
- The SAR distribution plots should be included in a separate attachment or appendix to the SAR report. The plots should be numbered sequentially and referenced in the tabulated SAR summary to facilitate review
- Information on test date, wireless mode, exposure configuration and test position, test channel & frequency, SAR probe serial number, probe conversion factors, transmission duty factor, tissue dielectric parameters, area and zoom scan measurement resolutions and dimensions, measurement drifts, 1-g or 10-g SAR and highest extrapolated SAR must be included on each SAR plot, with the peak location(s) clearly identified
- SAR plot is required for the highest measured SAR in each exposure configuration, wireless mode and frequency band combination; for example, WCDMA head SAR at 1900 MHz. Plots are also required when the measured SAR is > 1.5 W/kg, or > 7.0 W/kg for occupational exposure.
- The relevant boundaries of the test device should be correctly illustrated on SAR plots with peak SAR location(s) identified on the SAR distribution.
- Z-axis plots are generally optional; these are included to address certain specific concerns, as determined by the test laboratory and measurement results. When Z-axis plots are included, the results should be extrapolated to the phantom surface and the purpose of the plots must be clearly explained in the SAR report.
- The SAR numbers listed on the grant(s) of equipment authorization must be identified at the beginning of the SAR report, for each equipment class, according to procedures in KDB Publication 690783 D01. These reported SAR numbers should be highlighted in the SAR summary results for easy reference
- The SAR numbers listed on the grant(s) of equipment authorization must be identified at the beginning of the SAR report, for each equipment class, according to procedures in KDB Publication 690783 D01
- General specifications of the SAR system, SAR probe and dipole calibration certificates and results, tissue-equivalent media recipes, SAR system verification (dipole) plots, generic test setup photos and SAR system validation status information etc. should be included in a separate attachment or appendix to the SAR report

5 Product specific SAR Evaluation Procedures

5.1 SAR Evaluation for UMPC Mini-Tablets

| SAR Evaluation for UMPC Mini-Tablets (FCC KDB 941225 D07) |
|--|
| <ul style="list-style-type: none"> – for certain small hand-held tablets and devices of similar form factors that are designed primarily for interactive hand-held use next to or near the body of users (devices are typically operated like a mini-tablet and are usually designed with certain UMPC features and operating characteristics) – test procedures are applicable to devices with a display and overall diagonal dimension ≤ 20 cm <p>Larger devices</p> <ul style="list-style-type: none"> – For larger tablets with a display or overall diagonal dimension > 20 cm, the SAR procedures in KDB Publication 616217 D04 are required <p>Test distance 5 mm</p> <ul style="list-style-type: none"> – A composite test separation distance of 5 mm is applied <p>Test distance 10 mm</p> <ul style="list-style-type: none"> – Depending on the device form factor, antenna locations, operating configurations and exposure conditions, a test separation distance up to 10 mm may be considered for some devices <ul style="list-style-type: none"> Under such circumstances, 10-g extremity SAR must also be measured at zero test separation for all measured 1-g (10 mm) SAR configurations to address hand exposure A KDB inquiry is required to determine 10 mm is acceptable for measuring 1-g SAR <p>SAR testing</p> <ul style="list-style-type: none"> – UMPC mini-tablet devices must be tested for 1-g SAR on all surfaces and side edges with a transmitting antenna located at ≤ 25 mm from that surface or edge, at 5 mm separation from a flat phantom, for the data modes, wireless technologies and frequency bands supported by the device to determine SAR compliance – When 1-g SAR is tested at 5 mm, 10-g SAR is not required <p>Voice mode</p> <ul style="list-style-type: none"> – When voice mode applies (speaker mode only) and the exposure conditions are not adequately covered by the data mode SAR results, additional SAR tests for voice mode may be required <p>Next to ear</p> <ul style="list-style-type: none"> – When next to the ear voice operations are supported, the handset and phablet procedures in KDB Publication 648474 D04 must be applied <p>Hotspot mode</p> <ul style="list-style-type: none"> – When the maximum output power levels of transmitters used in hotspot mode are not higher than those tested using UMPC minitablet procedures the more conservative UMPC mini-tablet SAR results can be used to support hotspot mode <p>Simultaneous transmission</p> <ul style="list-style-type: none"> – For simultaneous transmission conditions, the procedures described in KDB Publication 447498 D01 are used to determine 1-g SAR test exclusion and SAR test requirements <p>Proximity sensing</p> <ul style="list-style-type: none"> – Some UMPC mini-table devices may incorporated proximity sensing and power reduction mechanisms to address RF exposure and simultaneous transmission concerns. The proximity sensor triggering distance and coverage tests described in KDB Publication 616217 D04 for full size tablets should be applied to determine the non-reduced full power SAR test separation distance required for UMPC mini-tablets |

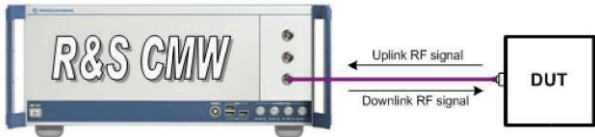

5.2 SAR Evaluation for Handsets with Hotspot mode

| SAR Evaluation for Handsets with Hotspot mode (FCC KDB 941225 D06) |
|---|
| <ul style="list-style-type: none"> – All applicable standalone and simultaneous transmission use conditions must be taken into consideration to determine SAR compliance – The head, body-worn accessory, next to body and hotspot mode SAR results are used to determine simultaneous transmission SAR test exclusion for these exposure conditions <p>Near-body and hand-held use</p> <ul style="list-style-type: none"> – SAR is measured for all edges and surfaces of the device with a transmitting antenna located within 25 mm from that surface or edge for the data modes, wireless technologies and frequency bands supporting hotspot mode – The SAR test separation distance for hotspot mode is determined according to device form factor <ul style="list-style-type: none"> When the overall length and width of a device is > 9 cm x 5 cm (~3.5" x 2") <ul style="list-style-type: none"> A test separation distance of 10 mm is required for hotspot mode SAR measurements Smaller devices <ul style="list-style-type: none"> A test separation distance of 5 mm or less is required – The combination of test distance and 1-g SAR measurements required for near-body exposure also supports hand-held exposure; therefore, separate 10-g extremity SAR evaluation is not necessary – The SAR results are used to determine simultaneous transmission SAR test exclusion for hotspot mode; otherwise, simultaneous transmission SAR measurement is required – For standalone battery-operated wireless router devices that require an external peripheral transmitter, such as an approved Wi-Fi or WWAN USB dongle or ExpressCard, to support hotspot mode: <ul style="list-style-type: none"> A reported SAR of 1.6 W/kg is used for the external transmitter to determine simultaneous transmission SAR test exclusion <ul style="list-style-type: none"> This excludes the use of sum of 1-g simultaneous transmission SAR test exclusion; the SAR to peak location separation ratio exclusion must be applied For USB dongles, the peak SAR location is assumed to be at 1 cm or less from the router surface, on the USB dongle For transmitter cards, SAR test exclusion is determined with peak SAR located at the edge of the router surface, centered along the plugin card slot If the built-in transmitter qualifies for SAR test exclusion; for example, a Wi-Fi module, the estimated SAR procedures in KDB Publication 447498 D01 is applied in conjunction with the 1.6 W/kg assumed for an external transmitter to determine SAR to peak location ratio SAR test exclusion <p>Head and body-worn accessory</p> <ul style="list-style-type: none"> – When the same wireless mode transmission configurations for voice and data are required for SAR measurements, the more conservative configuration with a smaller separation distance should be tested for the overlapping SAR configurations <ul style="list-style-type: none"> This typically applies to the back and front surfaces of a handset when SAR is required for both hotspot mode and body-worn accessory exposure conditions For devices with dimension > 9 cm x 5 cm <ul style="list-style-type: none"> the test separation distance used for hotspot mode SAR measurement is either 10 mm or that used in the body-worn accessory configuration, whichever is less For smaller devices with dimensions ≤ 9 cm x 5 cm <ul style="list-style-type: none"> a test separation of ≤ 5 mm must be used The combination of test distance and 1-g SAR measurements required for near-body exposure also supports hand-held exposure; therefore, separate 10-g extremity SAR evaluation is not necessary – When hotspot mode is enabled during voice calls, SAR compliance must be addressed for simultaneous voice and hotspot mode data in head (next to the ear) and body-worn accessory use conditions <ul style="list-style-type: none"> When separate transmitters are used, simultaneous transmission SAR for voice and hotspot mode data must be addressed |

6 Technology specific SAR Evaluation Procedures

6.1 GSM

| Evaluation Information |
|---|
| <p>Frequency ranges and channel bandwidths: Each frequency band for devices operating in GSM/GPRS/EDGE modes</p> <p>Channel selection: The required test channels for each channel bandwidth and frequency band Per KDB 941225 D01; the channel selection criteria of KDB 447498 D01 must be applied otherwise, the low, mid, high channel should be used</p> <p>Antenna implementation: Antenna usage for the different operational modes and configurations are listed</p> <p>Voice and data mode: The applicability of voice and data modes for each rf-exposure configuration</p> <p>Power class: The power class of the radio implementation</p> <p>Nominal and maximum output power and tune-up tolerance: For modes with the same specified maximum output power and tolerance, the higher number time-slot configuration should be tested</p> <p>Conducted and radiated output power of wireless modes: On the required test channels (low, mid, high) the conducted output power levels are measured for all applicable modes</p> |

| Evaluation Test Mode |
|--|
| <p>Test mode setup: Manufacturer tool based test mode</p>  <p>Modulation: All modes (modulations and data rates) used by the EUT</p> <p>Voice / Data - Mode GSM voice mode → transmit with 1 time slot GPRS and EDGE → may transmit up to 4 time slots Class A device → Dual Transfer Mode defined by the multislot classes (see 3GPP TS 43.055 and TS 45.001)</p> |

| Evaluation Steps |
|---|
| <p>Rated highest maximum output power: 1. The highest rated conducted output power is listed for all relevant operational modes</p> <p>Conducted output power: 2. The actual conducted output power is measured in test mode on the required test channels (low, mid, high) and it is verified that the actual output power is within 2 dB of the highest rated output power 3. The duty cycle of the test mode is measured and recorded</p> <p>Test exclusion: 4. The test separation distance is determined with respect to the applicable device use cases</p> |

5. Using the highest rated maximum output power values a test exclusion is performed according to KDB 447498 D01 and RSS-102

Tissue Simulating Liquid and System Validation:

6. The tissue simulating liquid is checked and the system validation is performed directly before SAR testing
Tissue simulating liquid and system validation is repeated every 48 h if needed

SAR Measurement:

7. SAR is measured using test mode for all test positions on the channel and operational mode combination with the highest actual output power
8. For modes with the same specified maximum output power and tolerance, the higher number time-slot configuration should be tested
8. The measured SAR values are scaled to the highest rated maximum output power value for the operational mode under test
9. The general test exclusion of KDB 447498 D01 is followed for the applicability of SAR testing to the other required test channels
10. When the 1g-SAR value is ≤ 0.8 W/kg it is not necessary to measure SAR for the other channels

SAR Repeatability:

10. If needed due to SAR results, repeated measurements are performed after all other SAR tests are finished

DUT Holder Perturbations:

11. If needed due to SAR results DUT holder perturbation verification is performed

6.2 MedRadio

| Evaluation Information |
|---|
| <p>Nominal and maximum output power and tune-up tolerance: The nominal and maximum conducted output power levels are given</p> <p>Conducted and radiated output power of wireless modes: On the required test channels (low, mid, high) the conducted output power levels are measured at the maximum achievable duty cycle</p> <p>Transmission duty factor: The duty factor is measured and reported as required per TCB workshop 2016-10</p> |

| Evaluation Test Mode |
|--|
| <p>Test mode setup: Manufacturer tool based test mode</p> <p>Modulation: All modes (modulations and data rates) used by the EUT</p> <p>Test packet interval: Maximum achievable duty factor</p> |

| Evaluation Steps |
|--|
| <p>Rated highest maximum output power: 1. The highest rated conducted output power is listed for all relevant operational modes</p> <p>Conducted output power: 2. The actual conducted output power is measured in test mode on the required test channels (low, mid, high) and it is verified that the actual output power is within 2 dB of the highest rated output power 3. The duty cycle of the test mode is measured and recorded</p> <p>Test exclusion: 4. The test separation distance is determined with respect to the applicable device use cases 5. Using the highest rated maximum output power values a test exclusion is performed according to KDB 447498 D01 and RSS-102</p> <p>Tissue Simulating Liquid and System Validation: 6. The tissue simulating liquid is checked and the system validation is performed directly before SAR testing Tissue simulating liquid and system validation is repeated every 48 h if needed</p> <p>SAR Measurement: 7. SAR is measured using test mode for all test positions on the channel and operational mode combination with the highest actual output power 8. The measured SAR values are scaled to the highest rated maximum output power value for the operational mode under test 9. The general test exclusion of KDB 447498 D01 is followed for the applicability of SAR testing to the other required test channels</p> <p>SAR Repeatability: 10. If needed due to SAR results, repeated measurements are performed after all other SAR tests are finished</p> <p>DUT Holder Perturbations: 11. If needed due to SAR results DUT holder perturbation verification is performed</p> |

7 SAR Evaluation for Standalone Transmitter Operation

7.1 Radio Chipset/Module 1: GSM

7.1.1 Maximum specified output power

| Maximum Specified Output Power incl. Tune-up Tolerance | | | | | |
|--|------------|--------------|-------------------------------|--------------------|------------------------------|
| Band | Modulation | Antenna Port | Maximum Conducted Power [dBm] | Antenna Gain [dBi] | Maximum Radiated Power [dBm] |
| GSM 850 | GPRS | GSM antenna | 33.2 | -2.4 | 30.8 |
| GSM 850 | EGPRS | GSM antenna | 33.1 | -2.4 | 30.7 |
| PCS 1900 | GPRS | GSM antenna | 28.3 | -2.9 | 25.4 |
| PCS 1900 | EGPRS | GSM antenna | 28.3 | -2.9 | 25.4 |

7.1.2 Conducted output power

| Source-based time-averaged conducted Output Power - Antenna: - Band: GSM850 | | | | | | | | |
|---|--------------|---------|-----------------|-------------------|---------------------------|---------------------------|----------------------------|----------------|
| Mode | Antenna port | Channel | Frequency [MHz] | Burst Power [dBm] | Frame Average Power [dBm] | Burst Tune-up Power [dBm] | Power Scaling Factor c_P | Duty Cycle [%] |
| GPRS 1 TX Slot | 1 | 128 | 824.2 | 33.10 | 24.07 | 34.5 | 1.230 | 12.5 |
| | | 188 | 836.2 | 33.00 | 23.97 | 34.5 | 1.259 | 12.5 |
| | | 251 | 848.0 | 33.20 | 24.17 | 34.5 | 1.202 | 12.5 |
| EGPRS 1 TX Slot | 1 | 128 | 824.2 | 33.1 | 24.07 | 34.5 | 1.230 | 12.5 |
| | | 188 | 836.2 | 33.0 | 23.97 | 34.5 | 1.259 | 12.5 |
| | | 251 | 848.0 | 33.1 | 24.07 | 34.5 | 1.230 | 12.5 |

Notes

- 1: Conducted power is RMS average power
- 2: Frame average power is calculated from conducted power by duty cycle correction:
 1 Tx Slot = $10 \cdot \log_{10}(1/8) = -9.03$ dB
 2 Tx Slots = $10 \cdot \log_{10}(2/8) = -6.02$ dB
 3 Tx Slots = $10 \cdot \log_{10}(3/8) = -4.26$ dB
 4 Tx Slots = $10 \cdot \log_{10}(4/8) = -3.01$ dB

| Source-based time-averaged conducted Output Power - Antenna: - Band: PCS1900 | | | | | | | | |
|--|--------------|---------|-----------------|-------------------|---------------------------|---------------------------|----------------------------|----------------|
| Mode | Antenna port | Channel | Frequency [MHz] | Burst Power [dBm] | Frame Average Power [dBm] | Burst Tune-up Power [dBm] | Power Scaling Factor c_P | Duty Cycle [%] |
| GPRS 1 TX Slot | 1 | 512 | 1850.2 | 28.30 | 19.27 | 29.5 | 1.175 | 12.5 |
| | | 661 | 1880 | 28.20 | 19.17 | 29.5 | 1.202 | 12.5 |
| | | 810 | 1909.8 | 28.30 | 19.27 | 29.5 | 1.175 | 12.5 |
| EGPRS 1 TX Slot | 1 | 512 | 1850.2 | 28.30 | 19.27 | 29.5 | 1.175 | 12.5 |
| | | 661 | 1880 | 28.20 | 19.17 | 29.5 | 1.202 | 12.5 |
| | | 810 | 1909.8 | 28.30 | 19.27 | 29.5 | 1.175 | 12.5 |

Notes

- 1: Conducted power is RMS average power
- 2: Frame average power is calculated from conducted power by duty cycle correction:
 1 Tx Slot = $10 \cdot \log_{10}(1/8) = -9.03$ dB
 2 Tx Slots = $10 \cdot \log_{10}(2/8) = -6.02$ dB
 3 Tx Slots = $10 \cdot \log_{10}(3/8) = -4.26$ dB
 4 Tx Slots = $10 \cdot \log_{10}(4/8) = -3.01$ dB

7.1.3 Product specific SAR evaluation requirements

| UMPC mini-tablet devices (1-g) SAR | | | | | |
|------------------------------------|---------------|--|-----------------------------|--------------|------|
| Antenna | Test Position | Antenna to DUT Surface Separation [mm] | DUT to User Separation [mm] | SAR Required | Note |
| LTE antenna | Front | < 25 | 10 | Yes | 1 |
| LTE antenna | Back | < 25 | 10 | Yes | 1 |
| LTE antenna | Top | < 25 | 10 | Yes | 1 |
| LTE antenna | Bottom | > 25 | 10 | No | 1 |
| LTE antenna | Left | < 25 | 10 | Yes | 1 |
| LTE antenna | Right | < 25 | 10 | Yes | 1 |

| Notes | |
|-------|--|
| 1: | UMPC mini-tablet devices must be tested for 1-g SAR on all surfaces and side edges with a transmitting antenna located at ≤ 25 mm from that surface or edge, at 5 mm separation from a flat phantom; When 1-g SAR is tested at 5 mm, 10-g SAR is not required |

7.1.4 General maximum output power based test exclusion per KDB 447498 D01

| SAR Test Exclusion | | | | | | | | | |
|----------------------|----------------|-----------------|----------|-----------------------------|----------------------------|--------------------|----------------------|--------------|------|
| SAR Mode | Operating Band | Frequency [MHz] | Position | Tune-up Average Power [dBm] | Tune-up Average Power [mW] | Test Distance [mm] | Threshold Power [mW] | SAR Required | Note |
| Antenna: GSM antenna | | | | | | | | | |
| 1-g | GSM850 | 848.0 | Front | 34.5 | 2818 | 10 | 33 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Back | 34.5 | 2818 | 10 | 33 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Top | 34.5 | 2818 | 10 | 33 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Bottom | 34.5 | 2818 | 10 | 33 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Left | 34.5 | 2818 | 10 | 33 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Right | 34.5 | 2818 | 10 | 33 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Front | 29.5 | 891 | 10 | 22 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Back | 29.5 | 891 | 10 | 22 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Top | 29.5 | 891 | 10 | 22 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Bottom | 29.5 | 891 | 10 | 22 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Left | 29.5 | 891 | 10 | 22 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Right | 29.5 | 891 | 10 | 22 | Yes | 1 |

| Notes |
|---|
| 1: All surfaces and edges with a maximum power below the threshold power are excluded from SAR measurements; for all other surfaces or edges SAR measurements must be performed |

7.1.5 General maximum output power based test exclusion per RSS-102

| SAR Test Exclusion | | | | | | | | | |
|----------------------|----------------|-----------------|----------|-----------------------------|----------------------------|--------------------|----------------------|--------------|------|
| SAR Mode | Operating Band | Frequency [MHz] | Position | Tune-up Average Power [dBm] | Tune-up Average Power [mW] | Test Distance [mm] | Threshold Power [mW] | SAR Required | Note |
| Antenna: LTE antenna | | | | | | | | | |
| 1-g | GSM850 | 848.0 | Front | 34.5 | 218.38 | 10 | 29.8 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Back | 34.5 | 218.38 | 10 | 29.8 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Top | 34.5 | 218.38 | 10 | 29.8 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Bottom | 34.5 | 218.38 | 10 | 29.8 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Left | 34.5 | 218.38 | 10 | 29.8 | Yes | 1 |
| 1-g | GSM850 | 848.0 | Right | 34.5 | 218.38 | 10 | 29.8 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Front | 29.5 | 891.28 | 10 | 9.9 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Back | 29.5 | 891.28 | 10 | 9.9 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Top | 29.5 | 891.28 | 10 | 9.9 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Bottom | 29.5 | 891.28 | 10 | 9.9 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Left | 29.5 | 891.28 | 10 | 9.9 | Yes | 1 |
| 1-g | GSM1900 | 1909.8 | Right | 29.5 | 891.28 | 10 | 9.9 | Yes | 1 |

| Notes |
|---|
| 1: All surfaces and edges with a maximum power below the threshold power are excluded from SAR measurements; for all other surfaces or edges SAR measurements must be performed |
| 2: Estimated SAR is calculated according to FCC KDB 447498 D01 from maximum conducted output power, operating frequency and test distance |

7.1.6 Tissue simulating liquid validations

| Tissue Validation | | | | | | | | | |
|-------------------|----------|------------|-----------------|--|----------|--------|-----------|-----------|------|
| Date | Tissue | Temp. [°C] | Frequency [MHz] | Liquid Parameter | Measured | Target | Delta [%] | Limit [%] | Note |
| 2021-03-16 | MSL-900 | 22.0 | 824.2 | Relative Permittivity (ϵ_r) | 54.636 | 55.242 | -1.10 | ± 5 | 1 |
| | | | | Conductivity (σ) | 0.951 | 0.969 | -1.87 | ± 5 | 1 |
| 2021-03-16 | MSL-900 | 22.0 | 836.2 | Relative Permittivity (ϵ_r) | 54.476 | 55.196 | -1.30 | ± 5 | 1 |
| | | | | Conductivity (σ) | 0.96 | 0.971 | -1.18 | ± 5 | 1 |
| 2021-03-16 | MSL-900 | 22.0 | 848.8 | Relative Permittivity (ϵ_r) | 54.434 | 55.158 | -1.31 | ± 5 | 1 |
| | | | | Conductivity (σ) | 0.975 | 0.987 | -1.21 | ± 5 | 1 |
| 2021-03-16 | MSL-900 | 22.0 | 900.0 | Relative Permittivity (ϵ_r) | 54.115 | 55.000 | -1.61 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.031 | 1.050 | -1.81 | ± 5 | 1 |
| 2021-03-18 | MSL-900 | 22.0 | 824.2 | Relative Permittivity (ϵ_r) | 54.591 | 55.242 | -1.18 | ± 5 | 1 |
| | | | | Conductivity (σ) | 0.951 | 0.969 | -1.87 | ± 5 | 1 |
| 2021-03-18 | MSL-900 | 22.0 | 836.2 | Relative Permittivity (ϵ_r) | 54.435 | 55.196 | -1.38 | ± 5 | 1 |
| | | | | Conductivity (σ) | 0.962 | 0.971 | -0.98 | ± 5 | 1 |
| 2021-03-18 | MSL-900 | 22.0 | 848.8 | Relative Permittivity (ϵ_r) | 54.338 | 55.158 | -1.49 | ± 5 | 1 |
| | | | | Conductivity (σ) | 0.974 | 0.987 | -1.32 | ± 5 | 1 |
| 2021-03-18 | MSL-900 | 22.0 | 900.0 | Relative Permittivity (ϵ_r) | 54.027 | 55.000 | -1.77 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.03 | 1.050 | -1.90 | ± 5 | 1 |
| 2021-03-24 | MSL-1900 | 21.0 | 1850.2 | Relative Permittivity (ϵ_r) | 52.352 | 53.300 | -1.78 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.506 | 1.520 | -0.92 | ± 5 | 1 |
| 2021-03-24 | MSL-1900 | 21.0 | 1880.0 | Relative Permittivity (ϵ_r) | 52.031 | 53.300 | -2.38 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.508 | 1.520 | -0.79 | ± 5 | 1 |
| 2021-03-24 | MSL-1900 | 21.0 | 1900.0 | Relative Permittivity (ϵ_r) | 52.017 | 53.300 | -2.41 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.492 | 1.520 | -1.84 | ± 5 | 1 |
| 2021-03-24 | MSL-1900 | 21.0 | 1909.8 | Relative Permittivity (ϵ_r) | 52.089 | 53.300 | -2.27 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.483 | 1.520 | -2.43 | ± 5 | 1 |
| 2021-03-26 | MSL-1900 | 22.0 | 1850.2 | Relative Permittivity (ϵ_r) | 52.728 | 53.300 | -1.07 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.528 | 1.520 | 0.53 | ± 5 | 1 |
| 2021-03-26 | MSL-1900 | 22.0 | 1880.0 | Relative Permittivity (ϵ_r) | 52.53 | 53.300 | -1.44 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.559 | 1.520 | 2.57 | ± 5 | 1 |
| 2021-03-26 | MSL-1900 | 22.0 | 1900.0 | Relative Permittivity (ϵ_r) | 52.374 | 53.300 | -1.74 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.579 | 1.520 | 3.88 | ± 5 | 1 |
| 2021-03-26 | MSL-1900 | 22.0 | 1909.8 | Relative Permittivity (ϵ_r) | 52.257 | 53.300 | -1.96 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.584 | 1.520 | 4.21 | ± 5 | 1 |
| 2021-03-29 | MSL-1900 | 21.0 | 1850.2 | Relative Permittivity (ϵ_r) | 52.511 | 53.300 | -1.48 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.563 | 1.520 | 2.83 | ± 5 | 1 |
| 2021-03-29 | MSL-1900 | 21.0 | 1880.0 | Relative Permittivity (ϵ_r) | 52.148 | 53.300 | -2.16 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.577 | 1.520 | 3.75 | ± 5 | 1 |
| 2021-03-29 | MSL-1900 | 21.0 | 1900.0 | Relative Permittivity (ϵ_r) | 52.04 | 53.300 | -2.36 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.568 | 1.520 | 3.16 | ± 5 | 1 |
| 2021-03-29 | MSL-1900 | 21.0 | 1909.8 | Relative Permittivity (ϵ_r) | 52.059 | 53.300 | -2.33 | ± 5 | 1 |
| | | | | Conductivity (σ) | 1.563 | 1.520 | 2.83 | ± 5 | 1 |

Notes

- 1: Per KDB 865664 D01 the measured ϵ_r and σ of the tissue-equivalent medium used during probe calibration must be within 5% of the target parameters

7.1.7 System validations

| System Validation | | | | | | | | | | | | | |
|-------------------|---------|----------|-----|-----------------|------------|-------------------|------------------|---------------------|----------------------|----------------------|-----------|-----------|------|
| Date | Dipole | Tissue | SAR | Frequency [MHz] | Power [mW] | Liquid Temp. [°C] | Power Drift [dB] | Measured SAR [W/kg] | Scaled 1W SAR [W/kg] | Target 1W SAR [W/kg] | Delta [%] | Limit [%] | Plot |
| 2021-03-16 | D900V2 | MSL-900 | 1-g | 900 | 250 | 22 | 0.03 | 2.8 | 11.2 | 11.1 | 0.9 | ± 10 | 1 |
| 2021-03-17 | D900V2 | MSL-900 | 1-g | 900 | 250 | 22 | 0.02 | 2.75 | 11.00 | 11.1 | -0.9 | ± 10 | 2 |

| Notes | |
|-------|--|
| 1: | Per KDB 865664 D01 the 1-g and 10-g SAR measured with a reference dipole, using the required tissue-equivalent medium at the test frequency, must be within 10% of the manufacturer calibrated dipole SAR target |
| 2: | Per KDB 865664 D02 section 2.3 j) only the SAR system verification plots, with the largest deviation from the dipole or qualified source SAR target are to be reported for each dipole or qualified source |

7.1.8 SAR measurements

| SAR Measurements - Band: GSM 850 | | | | | | | | | | | | | | |
|----------------------------------|--------------------------------|---|------------------|----------|------------|-------|-------------|-------------------|---------------------|------------------|------------------|--------------|------|-------------------|

Notes

- 1: Measured SAR values are scaled to the maximum tune-up power specified for transmission mode
- 2: The power drift must be $\leq \pm 5\%$ or $\leq \pm 0.2$ dB

| 2021-03-30 | Liquid Temperature [°C] = 22.0 | | | | | | | | | | | |
| 2021-03-30 | GSM | Test Mode A CS1 1 Timeslot Gamma 3 | Body (1-g) | Front | 10 | 810 | 661 | 0.866 | 0.923 | 1.066 | 5 | |
| 2021-03-30 | GSM | Test Mode A CS1 1 Timeslot Gamma 3 | Body (1-g) | Front | 10 | 810 | 1909.8 | 0.819 | 0.889 | 1.085 | 7 | |

| Notes | |
|-------|--|
| 1: | Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg |
| 2: | When the original highest measured SAR is ≥ 0.80 W/kg, repeat that measurement once |
| 3: | Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/kg |
| 4: | Perform a third repeated measurement only if the original, first or second repeated measurement is ≥ 1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20 |

7.1.10 DUT Holder Perturbations

| DUT Holder Perturbations | | | | | | | | | | | | | | |
|--|---------------|------|------------------|----------|------------|---------|-------------|--------------------------|-----------------------------|--------------------------------|-------------------|---------------------------|------|------|
| Date | Configuration | | | Position | Dist. [mm] | Channel | | SAR | | | | | Plot | Note |
| | Ant. | Mode | Exposure Config. | | | Ch. | Freq. [MHz] | Original Reported [W/kg] | Original with holder [W/kg] | Repeated without holder [W/kg] | SAR Tolerance [%] | Corr. Reported SAR [W/kg] | | |
| While all SAR measurements the DUT was placed on a foam bloc. No influence of the DUT holder is assumed. (Annex C) | | | | | | | | | | | | | | |

| Notes | |
|-------|---|
| 1: | When the highest reported SAR of an antenna is > 1.2 W/kg (1-g) or 3.0 (10-g), holder perturbation verification is required for each antenna, using the highest SAR configuration among all applicable frequency bands |
| 2: | If the SAR tolerance is negative which means that the SAR value without DUT holder is larger than the SAR value with DUT holder, the reported SAR value is corrected by the SAR tolerance in order to take the decrease in SAR value because of the DUT holder into account |
| 3: | KDB inquiry is required if the highest reported SAR for each antenna, adjusted for increases in holder perturbation, would introduce noncompliance conditions or noticeably high differences due to perturbation |
