

Operational Description

731 Confirmation number; EA803615

My client advises that an operational description is contained within the Owners Manual which has been previously forwarded.

A copy of this manual has been forwarded to you again

Just in case this is not sufficient I have prepared a quick operational description which I hope will suffice.

The device tested consists of a handheld remote transmitter and a receiver.

The transmitter is a low power handheld device which is used to remotely control a vehicle security system.

The receiver is integrated into the security system.

Operation of the vehicle security system is achieved when a transmitted signal is received by the receiver.

This system allows the following typical operations:

- locking and unlocking the car doors
- activating and deactivating the vehicle security alarm
- panic mode operation
- car location
- automatic window closing

etc, etc, etc

If the security system is activated an audible siren is activated and the headlights and indicators are also activated.

The receiver is integrated into the security system that would be located securely within the vehicle.
