## 1. Test Standards and Report version

## 1.1. Test Standards

The tests were performed according to following standards:

FCC 47 Part 2.1093: Radiofrequency Radiation Exposure Evaluation:Portable Devices IEEE Std 1528<sup>™</sup>-2013: IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.

KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04: SAR Measurement Requirements for 100 MHz to 6 GHz

<u>KDB 865664 D02 RF Exposure Reporting v01r02:</u> RF Exposure Compliance Reporting and Documentation Considerations

<u>KDB 447498 D01 General RF Exposure Guidance v06:</u> Mobile and Portable Device RF Exposure Procedures and Equipment Authorization Policies

KDB 248227 D01 802 11 Wi-Fi SAR v02r02: SAR Measurement Proceduresfor802.11 a/b/g Transmitters KDB 648474 D04 Handset SAR v01r03: SAR Evaluation Considerations for Wireless Handsets KDB 941225 D01 3G SAR Procedures v03r01: SAR Measurement Procedures for 3G Devices KDB 941225 D06 Hotspot Mode v02r01: SAR Evaluation Procedures for Portable Devices with Wireless Router Capabilities

| WIFI 2.4G            |                                |
|----------------------|--------------------------------|
| Supported type:      | 802.11b/802.11g/802.11n(HT20)  |
| Modulation Type:     | DSSS for 802.11b               |
|                      | OFDM for 802.11g/802.11n(HT20) |
| Operation frequency: | 2412MHz~2462MHz                |
| Channel number:      | 11                             |
| Channel separation:  | 5MHz                           |
| Antenna type:        | FTP                            |
| Bluetooth            |                                |
| Version:             | Supported BT4.0+EDR            |
| Modulation:          | GFSK, π/4DQPSK, 8DPSK          |
| Operation frequency: | 2402MHz~2480MHz                |
| Channel number:      | 79                             |
| Channel separation:  | 1MHz                           |
| Antenna type:        | FTP                            |
| Bluetooth-BLE        |                                |
| Version:             | Supported BT4.0+BLE            |
| Modulation:          | GFSK                           |
| Operation frequency: | 2402MHz~2480MHz                |
| Channel number:      | 40                             |
| Channel separation:  | 2MHz                           |
| Antenna type:        | FTP                            |
| Remark:              |                                |

1. The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power

2. The Test EUT support two SIM card(SIM1,SIM2), so all the tests are performed at each SIM card (SIM1,SIM2) mode, the datum recorded is the worst case for all the mode at SIM1 Card mode.

## 3. Test Environment

#### 3.1. Test laboratory

Laboratory: Shenzhen Huatongwei International Inspection Co., Ltd. Address: 1/F, Bldg 3, Hongfa Hi-tech Industrial Park, Genyu Road, Tianliao, Gongming, Shenzhen, China

### 3.2. Test Facility

#### CNAS-Lab Code: L1225

Shenzhen Huatongwei International Inspection Co., Ltd. has been assessed and proved to be in compliance with CNAS-CL01 Accreditation Criteria for Testing and Calibration Laboratories (identical to ISO/IEC17025: 2005 General Requirements) for the Competence of Testing and Calibration Laboratories.

#### A2LA-Lab Cert. No.: 3902.01

Shenzhen Huatongwei International Inspection Co., Ltd. EMC Laboratory has been accredited by A2LA for technical competence in the field of electrical testing, and proved to be in compliance with ISO/IEC 17025: 2005 General Requirements for the Competence of Testing and Calibration Laboratories and any additional program requirements in the identified field of testing.

#### FCC-Registration No.: 762235

Shenzhen Huatongwei International Inspection Co., Ltd. EMC Laboratory has been registered and fully described in a report filed with the FCC (Federal Communications Commission). The acceptance letter from the FCC is maintained in our files. Registration 762235.

#### IC-Registration No.: 5377B-1

Two 3m Alternate Test Site of Shenzhen Huatongwei International Inspection Co., Ltd. has been registered by Certification and Engineering Bureau of Industry Canada for the performance of radiated measurements with Registration No. 5377B-1.

#### ACA

Shenzhen Huatongwei International Inspection Co., Ltd. EMC Laboratory can also perform testing for the Australian C-Tick mark as a result of our A2LA accreditation.

### 3.3. Environmental conditions

During the measurement the environmental conditions were within the listed ranges:

| Ambient temperature |                  | 18 °C to 25 °C |  |
|---------------------|------------------|----------------|--|
|                     | Ambient humidity | 30%RH to 70%RH |  |
|                     | Air Pressure     | 950-1050mbar   |  |

Note:

1. The Probe, Dipole and DAE calibration reference to the Appendix B and C.

2. Referring to KDB865664 D01, the dipole calibration interval can be extended to 3 years with justificatio. The dipole are also not physically damaged or repaired during the interval.

## 5. <u>Measurement Uncertainty</u>

Per KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz, when the highest measured 1-g SAR within a frequency band is < 1.5 W/kg. The expanded SAR measurement uncertainty must be  $\leq$  30%, for a confidence interval of k = 2. If these conditions are met, extensive SAR measurement uncertainty analysis described in IEEE Std 1528-2013 is not required in SAR reports submitted for equipment approval.

## 6. SAR Measurements System Configuration

#### 6.1. SAR Measurement Set-up

The DASY5 system for performing compliance tests consists of the following items:

A standard high precision 6-axis robot (Stäubli RX family) with controller and software. An arm extension for accommodating the data acquisition electronics (DAE).

A dosimetric probe, i.e. an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.

A data acquisition electronic (DAE) which performs the signal amplification, signal multiplexing, ADconversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.

A unit to operate the optical surface detector which is connected to the EOC.

The Electro-Optical Coupler (EOC) performs the conversion from the optical into a digital electric signal of the DAE. The EOC is connected to the DASY5 measurement server.

The DASY5 measurement server, which performs all real-time data evaluation for field measurements and surface detection, controls robot movements and handles safety operation. A computer operating Windows 2003.

DASY5 software and SEMCAD data evaluation software.

Remote control with teach panel and additional circuitry for robot safety such as warning lamps, etc.

The generic twin phantom enabling the testing of left-hand and right-hand usage.

The device holder for handheld Mobile Phones.

Tissue simulating liquid mixed according to the given recipes.

System validation dipoles allowing to validate the proper functioning of the system.

## 6.2. DASY5 E-field Probe System

The SAR measurements were conducted with the dosimetric probe EX3DV4 (manufactured by SPEAG), designed in the classical triangular configuration and optimized for dosimetric evaluation.

#### • Probe Specification

| Construction  | Symmetrical design with triangular core<br>Interleaved sensors<br>Built-in shielding against static charges<br>PEEK enclosure material (resistant to organic solvents, e.g., D0 | GBE) |
|---------------|---|------|

#### • Isotropic E-Field Probe

The isotropic E-Field probe has been fully calibrated and assessed for isotropicity, and boundary effect within a controlled environment. Depending on the frequency for which the probe is calibrated the method utilized for calibration will change.

The E-Field probe utilizes a triangular sensor arrangement as detailed in the diagram below:

### 6.3. Phantoms

The phantom used for all tests i.e. for both system checks and device testing, was the twin-headed "SAM Phantom", manufactured by SPEAG. The SAM twin phantom is a fiberglass shell phantom with 2mm shell thickness (except the ear region, where shell thickness increases to 6mm).

System checking was performed using the flat section, whilst Head SAR tests used the left and right head profile sections. Body SAR testing also used the flat section between the head profiles.

SAM Twin Phantom

### 6.4. Device Holder

The device was placed in the device holder (illustrated below) that is supplied by SPEAG as an integral part of the DASY system.

The DASY device holder is designed to cope with the different positions given in the standard. It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points). The rotation centers for both scales is the ear reference point (ERP). Thus the device needs no repositioning when changing the angles.

Device holder supplied by SPEAG

# 7. SAR Test Procedure

### 7.1. Scanning Procedure

The DASY5 installation includes predefined files with recommended procedures for measurements and validation. They are read-only document files and destined as fully defined but unmeasured masks. All test positions (head or body-worn) are tested with the same configuration of test steps differing only in the grid definition for the different test positions.

The "reference" and "drift" measurements are located at the beginning and end of the batch process. They measure the field drift at one single point in the liquid over the complete procedure. The indicated drift is mainly the variation of the DUT's output power and should vary max.  $\pm 5$  %.

The "surface check" measurement tests the optical surface detection system of the DASY5 system by repeatedly detecting the surface with the optical and mechanical surface detector and comparing the results. The output gives the detecting heights of both systems, the difference between the two systems and the standard deviation of the detection repeatability. Air bubbles or refraction in the liquid due to separation of the sugar-water mixture gives poor repeatability (above  $\pm 0.1$ mm). To prevent wrong results tests are only executed when the liquid is free of air bubbles. The difference between the optical surface detection and the actual surface depends on the probe and is specified with each probe (It does not depend on the surface reflectivity or the probe angle to the surface within  $\pm 30^{\circ}$ .)

#### Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values before running a detailed measurement around the hot spot.Before starting the area scan a grid spacing of 15 mm x 15 mm is set. During the scan the distance of the probe to the phantom remains unchanged. After finishing area scan, the field maxima within a range of 2 dB will be ascertained.

#### Zoom Scan

After the maximum interpolated values were calculated between the points in the cube, the SAR was averaged over the spatial volume (1g or 10g) using a 3D-Spline interpolation algorithm. The 3D-spline is composed of three one-dimensional splines with the "Not a knot" condition (in x, y, and z directions). The volume was then integrated with the trapezoidal algorithm.

#### **Spatial Peak Detection**

The procedure for spatial peak SAR evaluation has been implemented and can determine values of masses of 1g and 10g, as well as for user-specific masses. The DASY5 system allows evaluations that combine measured data and robot positions, such as:

- maximum search
- extrapolation
- boundary correction
- peak search for averaged SAR

During a maximum search, global and local maxima searches are automatically performed in 2-D after each Area Scan measurement with at least 6 measurement points. It is based on the evaluation of the local SAR gradient calculated by the Quadratic Shepard's method. The algorithm will find the global maximum and all local maxima within -2 dB of the global maxima for all SAR distributions.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. Several measurements at different distances are necessary for the extrapolation. Extrapolation routines require at least 10 measurement points in 3-D space.

They are used in the Zoom Scan to obtain SAR values between the lowest measurement points and the inner phantom surface. The routine uses the modified Quadratic Shepard's method for extrapolation.

A Z-axis scan measures the total SAR value at the x-and y-position of the maximum SAR value found during the cube scan. The probe is moved away in z-direction from the bottom of the SAM phantom in 5mm steps.

### Table 1: Area and Zoom Scan Resolutions per FCC KDB Publication 865664 D01v04

Note:  $\delta$  is the penetration depth of a plane-wave at normal incidence to the tissue medium; see IEEE Std 1528-2013 for details.

\* When zoom scan is required and the <u>reported</u> SAR from the *area scan based 1-g SAR estimation* procedures of KDB Publication 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

### 7.2. Data Storage and Evaluation

#### Data Storage

The DASY5 software stores the acquired data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors),s together with all necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files with the extension ".DA4". The software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of incorrect parameter settings. For example, if a measurement has been performed with a wrong crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be re-evaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type ([V/m], [A/m], [°C], [W/kg], [mW/cm<sup>2</sup>], [dBrel], etc.). Some of these units are not available in certain situations or show meaningless results, e.g., a SAR output in a lossless media will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

#### **Data Evaluation**

The SEMCAD software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

| Probe parameters:  | Sensitivity:             | Normi, ai0, ai1, ai2 |
|--------------------|--------------------------|----------------------|
|                    | Conversion factor:       | ConvFi               |
|                    | Diode compression point: | Dcpi                 |
| Device parameters: | Frequency:               | f                    |
|                    | Crest factor:            | cf                   |
| Media parameters:  | Conductivity:            | σ                    |
|                    | Density:                 | ρ                    |

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY5 components. In the direct measuring mode of the multimeter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

 $V_i = U_i + U_i^2 \cdot \frac{cf}{dcp_i}$ 

Vi: compensated signal of channel ( i = x, y, z )

Ui: input signal of channel (i = x, y, z)

cf: crest factor of exciting field (DASY parameter)

dcpi: diode compression point (DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated:

E – fieldprobes : 
$$E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$
  
H – fieldprobes :  $H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{c_{i1}^2}$ 

Vi:compensated signal of channel (
$$i = x, y, z$$
)Normi:sensor sensitivity of channel ( $i = x, y, z$ ),  
[mV/(V/m)2] for E-field ProbesConvF:sensitivity enhancement in solution  
aij:sensor sensitivity factors for H-field probesf:carrier frequency [GHz]Ei:electric field strength of channel i in V/mHi:magnetic field strength of channel i in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1'000}$$

- SAR: local specific absorption rate in W/kg
- Etot: total field strength in V/m
- σ: conductivity in [mho/m] or [Siemens/m]
- ρ: equivalent tissue density in g/cm3

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid.

## 8. Position of the wireless device in relation to the phantom

## 8.1. Head Position

The wireless device define two imaginary lines on the handset, the vertical centreline and the horizontal line, for the handset in vertical orientation as shown in Figures 5a and 5b.

**The vertical centreline** passes through two points on the front side of the handset: the midpoint of the width  $W_t$  of the handset at the level of the acoustic output (point A in Figures 5a and 5b), and the midpoint of the width  $W_b$  of the bottom of the handset (point B).

The horizontal line is perpendicular to the vertical centreline and passes through the centre of the acoustic output (see Figures 5a and 5b). The two lines intersect at point A.

Note that for many handsets, point A coincides with the centre of the acoustic output. However, the acoustic output may be located elsewhere on the horizontal line. Also note that the vertical centreline is not necessarily parallel to the front face of the handset (see Figure 5b), especially for clam-shell handsets,

handsets with flip cover pieces, and other irregularly shaped handsets.

Figures 5a

Figures 5b

- Wt Width of the handset at the level of the acoustic
- W<sub>b</sub> Width of the bottom of the handset

- B Midpoint of the width wb of the bottom of the handset

**Cheek position** 

**Tilt position** 

Picture 2 Cheek position of the wireless device on the left side of SAM

RE LE M LE

Picture 3 Tilt position of the wireless device on the left side of SAM

## 8.2. Body Position

Devices that support transmission while used with body-worn accessories must be tested for body-worn accessory SAR compliance, typically according to the smallest test separation distance required for the group of body-worn accessories with similar operating and exposure characteristics.

Devices that are designed to operate on the body of users using lanyards and straps or without requiring additional body-worn accessories must be tested for SAR compliance using a conservative minimum test separation distance  $\leq 5 \text{ mm}$  to support compliance.

Picture 4 Test positions for body-worn devices

### 8.3. Hotspot Mode Exposure conditions

The hotspot mode and body-worn accessory SAR test configurations may overlap for handsets. When the same wireless mode transmission configurations for voice and data are required for SAR measurements, the more conservative configuration with a smaller separation distance should be tested for the overlapping SAR configurations. This typically applies to the back and front surfaces of a handset when SAR is required for both hotspot mode and body-worn accessory exposure conditions. Depending on the form factor and dimensions of a device, the test separation distance used for hotspot mode SAR measurement is either 10 mm or that used in the body-worn accessory configuration, whichever is less for devices with dimension > 9 cm x 5 cm. For smaller devices with dimensions  $\leq$  9 cm x 5 cm because of a greater potential for next to body use a test separation of  $\leq$  5 mm must be used.

Picture 5 Test positions for Hotspot Mode

# 9. System Check

## 9.1. Tissue Dielectric Parameters

The liquid has previously been proven to be suited for worst-case. It's satisfying the latest tissue dielectric parameters requirements proposed by the KDB865664.

| Tissue dielectric parameters for head and body phantoms |                            |        |      |        |  |  |  |

## 9.2. SAR System Check

The purpose of the system check is to verify that the system operates within its specifications at the decice test frequency. The system check is simple check of repeatability to make sure that the system works correctly at the time of the compliance test;

System check results have to be equal or near the values determined during dipole calibration with the relevant liquids and test system (±10%).

System check is performed regularly on all frequency bands where tests are performed with the DASY5 system.

System Performance Check Setup

- DASY52 52.10.0(1446); SEMCAD X 14.6.10(7417)

## Body/d=10mm,Pin=250mW/Area Scan (71x71x1): Interpolated grid: dx=1.200 mm,

dy=1.200 mm Maximum value of SAR (interpolated) = 21.1 W/kg

Body/d=10mm,Pin=250mW/Zoom Scan (7x7x7)/Cube 0: Measurement grid: dx=5mm,

dy=5mm, dz=5mm Reference Value = 105.6 V/m; Power Drift = -0.01 dB Peak SAR (extrapolated) = 25.7 W/kg SAR(1 g) = 12.5 W/kg; SAR(10 g) = 5.83 W/kg Maximum value of SAR (measured) = 20.7 W/kg

0 dB = 7.47 W/kg = 8.73 dBW/kg

## 10. SAR Exposure Limits

SAR assessments have been made in line with the requirements of FCC 47 CFR § 2.1093.

|   | Limit (\                          | N/kg)                           |
|---|-----------------------------------|---------------------------------|
| Type Exposure   | General Population /              | Occupational /                  |
|   | Uncontrolled Exposure Environment | Controlled Exposure Environment |
| Spatial Average SAR<br>(whole body)                     | 0.08                              | 0.4                             |
| Spatial Peak SAR<br>(1g cube tissue for head and trunk) | 1.6                               | 8.0                             |
| Spatial Peak SAR<br>(10g for limb)                      | 4.0                               | 20.0                            |

Population/Uncontrolled Environments: are defined as locations where there is the exposure of individual who have no knowledge or control of their exposure.

Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure (i.e. as a result of employment or occupation).

## 11. Conducted Power Measurement Results

## GSM Conducted Power

- 1. Per KDB 447498 D01, the maximum output power channel is used for SAR testing and further SAR test reduction
- 2. Per KDB 941225 D01, considering the possibility of e.g. 3rd party VoIP operation for Head and Bodyworn SAR test reduction for GSM and GPRS modes is determined by the source-base time-averaged output power including tune-up tolerance. The mode with highest specified time-averaged output power should be tested for SAR compliance in the applicable exposure conditions. For modes with the same specified maximum output power and tolerance, the higher number time-slot configuration should be tested. Therefore, the EUT was set in GPRS (2Tx slots) for GSM850 and GPRS (3Tx slots) for PCS1900.
- 3. Per KDB941225 D01, for hotspot SAR test reduction for GPRS modes is determined by the sourcebased time-averaged output power including tune-up tolerance, For modes with the same specified maximum output power and tolerance, the higher number time-slot configuration should be tested. Therefore, the EUT was set in GPRS (2Tx slots) for GSM850 and GPRS (3Tx slots) for PCS1900.

|         | 4TXslots | 24.43     | 24.69       | 24.39     | -3.01               | 21.42     | 21.68      | 21.38     |

Note:

1) Division Factors

To average the power, the division factor is as follows:

1TX-slot = 1 transmit time slot out of 8 time slots=> conducted power divided by (8/1) => -9.03dB 2TX-slots = 2 transmit time slots out of 8 time slots=> conducted power divided by (8/2) => -6.02dB 3TX-slots = 3 transmit time slots out of 8 time slots=> conducted power divided by (8/3) => -4.26dB 4TX-slots = 4 transmit time slots out of 8 time slots=> conducted power divided by (8/3) => -4.26dB

## WCDMA Conducted Power

- 1. The following tests were conducted according to the test requirements outlines in 3GPP TS34.121 specification.
- 2. The procedures in KDB 941225 D01 are applied for 3GPP Rel. 6 HSPA to configure the device in the required sub-test mode to determine SAR test exclusion

A summary of thest setting are illustrated belowe:

### HSDPA Setup Configureation:

- a) The EUT was connected to base station RS CMU200 referred to the setup configuration
- b) The RF path losses were compensated into the measurements
- c) A call was established between EUT and base station with following setting:
  - i. Set Gain Factors (βc and βd) and parameters were set according to each specific sub-test in the following table, C10.1.4, Quoted from the TS 34.121
  - ii. Set RMC 12.2Kbps + HSDPA mode
  - iii. Set Cell Power=-86dBm
  - iv. Set HS-DSCH Configuration Type to FRC (H-set 1, QPSK)
  - v. Select HSDPA uplink parameters
  - vi. Set Delta ACK, Delta NACK and Delta CQI=8
  - vii. Set Ack-Nack repetition Factor to 3
  - viii. Set CQI Feedback Cycle (K) to 4ms
  - ix. Set CQI repetition factor to 2
  - x. Power ctrl mode= all up bits
- d) The transmitter maximum output power waw recorded.

#### Table C.10.1.4: $\beta$ values for transmitter characteristics tests with HS-DPCCH

#### **Setup Configuration**

#### **HSUPA Setup Configureation:**

- a) The EUT was connected to base station RS CMU200 referred to the setup configuration
- b) The RF path losses were compensated into the measurements
- c) A call was established between EUT and base station with following setting:
  - i. Call configs = 5.2b, 5.9b, 5.10b, and 5.13.2B with QPSK
  - ii. Set Gain Factors (βc and βd) and parameters (AG index) were set according to each specific subtest in the following table, C11.1.3, Quoted from the TS 34.121
  - iii. Set Cell Power=-86dBm
  - iv. Set channel type= 12.2Kbps + HSPA mode
  - v. Set UE Target power
  - vi. Set Ctrl mode=Alternating bits
  - vii. Set and observe the E-TFCI
- viii. Confirm that E-TFCI is equal the target E-TFCI of 75 for Sub-test 1, and other subtest's E-TFCI
- d) The transmitter maximum output power waw recorded.

| Note 1: $\Delta_{ACK}$ , $\Delta_{NACK}$ and $\Delta_{CQI}$ = 30/15 with $\beta_{kc}$ = 30/15 * $\beta_c$ . |  |                      |                        |                                |                |                 |  |                         |                            |                           |                            |                            |            |
| Note 2  | Note 2: CM = 1 for $\beta_c/\beta_d$ =12/15, $\beta_{ns}/\beta_c$ =24/15. For all other combinations of DPDCH, DPCCH, HS- DPCCH, E-DPDCH and E-DPCCH the MPR is based on the relative CM difference. |                      |                        |                                |                |                 |  |                         |                            |                           |                            |                            |            |

Note 3: For subtest 1 the  $\beta_c/\beta_d$  ratio of 11/15 for the TFC during the measurement period (TF1, TF0) is achieved by setting the signalled gain factors for the reference TFC (TF1, TF1) to  $\beta_c = 10/15$  and  $\beta_d = 15/15$ .

Note 4: For subtest 5 the  $\beta_c/\beta_d$  ratio of 15/15 for the TFC during the measurement period (TF1, TF0) is achieved by setting the signalled gain factors for the reference TFC (TF1, TF1) to  $\beta_c = 14/15$  and  $\beta_d = 15/15$ . Note 5: In case of testing by UE using E-DPDCH Physical Layer category 1, Sub-test 3 is omitted according to

TS25.306 Table 5.1g. Note 6:  $\beta_{ed}$  can not be set directly, it is set by Absolute Grant Value.

#### **Setup Configuration**

#### **General Note:**

- 1. Per KDB 941225 D01, SAR for Head / Hotsport / Body-worn Exposure is measured using a 12.2Kbps RMC with TPC bit ocnfigured to all 1s
- Per KDB 941225 D01 RMC12.2Kbps setting is used to evaluate SAR. If the maximum output power and Tune-up tolerance specified for production units in HSDPA/HSUPA is ≤ 1/4dB higher than RMC 12.2Kbps or when the highest reported SAR of the RMC12.2Kbps is scaled by the ratio fo specified maximum output power and tune-up tolerance of HSDPA / HSUPA to RMC 12.2Kbps and the adjusted SAR is ≤ 1.2 W/kg, SAR measurement is not required for HSDPA / HSUPA.

### WLAN Conducted Power

For 2.4GHz WLAN SAR testing, highest average RF output power channel for the lowest data rate for 802.11b were for SAR evaluation. 802.11g/n were not investigated since the average putput powers over all channels and data rates were not more than 0.25dB higher than the tested channel in the lowest data rate of 802.11b mode.

| 802.11n(HT20)                                     | 15.20 |  |  |

| Bluetooth |                       |  |  |
|-----------|-----------------------|--|--|
| Mode      | Maximum Tune-up (dBm) |  |  |
| GFSK      | 7.00                  |  |  |
| π/4QPSK   | 7.00                  |  |  |
| 8DPSK     | 7.50                  |  |  |
| BLE       | -1.50                 |  |  |

Per KDB 447498 D01, the 1-g and 10-g SAR test exclusion thresholds for 100MHz to 6GHz at test separation distances ≦50mm are determined by:

[(max. Power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] \*  $[\sqrt{f(GHz)}] \leq 3.0$  for 1-g SAR

| Band/Mode Frequency<br>(GHz) | Desition | Tune-up Power |           | Separation Distance | Exclusion |            |
|------------------------------|----------|---------------|-----------|---------------------|-----------|------------|
|                              | (GHz)    | Position      | dBm       | mW                  | (mm)      | Thresholds |
| Divotooth                    | 2.45     | Head          | 7 50      | E 60                | 0         | 1.8        |
| Bluetooth 2                  | 2.45     | 2.45 Body     | 7.50 5.62 | 0.02                | 10        | 0.9        |

Per KDB 447498 D01, when the minimum test separation distance is <5mm, a distance of 5mm is applied to determine SAR test exclusion.

The test exclusion thereshold is  $\leq$ 3, SAR testing is not required.

## 13. Antenna Location

Rear View.

|         | Distance of the Antenna to the EUT surface/edge(mm)          |   |     |     |    |    |  |  |  |  |  |  |
|---------|--|---|-----|-----|----|----|--|--|--|--|--|--|
| Antenna | Antenna Rear Front Top side Bottom side Right side Left side |   |     |     |    |    |  |  |  |  |  |  |
| WWAN    | 2  | 3 | 136 | 2   | 2  | 15 |  |  |  |  |  |  |
| WIFI/BT | 2  | 3 | 2   | 137 | 22 | 29 |  |  |  |  |  |  |

| Positions for SAR tests; Hotspot mode |  |     |    |     |     |     |  |  |  |  |  |  |
|---------------------------------------|--|-----|----|-----|-----|-----|--|--|--|--|--|--|
| Antenna                               | Antenna Rear Front Top side Bottom side Right side Left side |     |    |     |     |     |  |  |  |  |  |  |
| WWAN                                  | Yes  | Yes | No | Yes | Yes | Yes |  |  |  |  |  |  |
| WIFI/BT                               | WIFI/BT Yes Yes Yes No Yes No                                |     |    |     |     |     |  |  |  |  |  |  |

General note:

Referring to KDB941225 D06, when the overall device length and width are >9cm\*5cm, the test distance is 10mm. SAR must be measured for all sides and surfaces with a transmitting antenna located within 25mm from that surface or edge.

 According to the above table, the initial test position for head is "LeftCheek", and its reported SAR is≤ 0.4W/kg. Thus further SAR measurement is not required for the other (remaining) test positions. Because the reported SAR of the highest measured maximum output power channel for the exposureconfiguration is ≤ 0.8W/kg, no further SAR testing is required for 802.11b DSSS in that exposureconfiguration.

2. When SAR measurement is required for 2.4 GHz 802.11g/n OFDM configurations, the measurement and test reduction procedures for OFDM are applied. SAR is not required for the following 2.4 GHz OFDM conditions.

a) When KDB Publication 447498 D01 SAR test exclusion applies to the OFDM configuration.

b) When the highest *reported* SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg,the 802.11g/n is not required.

Note:

1. According to the KDB248227 D01, The reported SAR must be scaled to 100% transmission duty factor to determine compliance at the maximum tune-up tolerance limit. A maximum transmission duty factor of 100% is achievable for WLAN in this project.

 According to the above table, the initial test position for body is "Rear", and its reported SAR is≤ 0.4W/kg. Thus further SAR measurement is not required for the other (remaining) test positions. Because the reported SAR of the highest measured maximum output power channel for the exposureconfiguration is ≤ 0.8W/kg, no further SAR testing is required for 802.11b DSSS in that exposureconfiguration.

| 802.11b | Front                          | 6         | 2437 | 100%               | 100%        | 0.212           | 0.212                  |  |  |  |  |  |  |
| 1Mbps   | Rear                           | 6         | 2437 | 100%               | 100%        | 0.310           | 0.310                  |  |  |  |  |  |  |

Note:

According to the KDB248227 D01, The reported SAR must be scaled to 100% transmission duty factor to determine compliance at the maximum tune-up tolerance limit. A maximum transmission duty factor of 100% is achievable for WLAN in this project.

#### Hotspot SAR

|           | Positions for SAR tests; Hotspot mode                        |     |    |     |     |     |  |  |  |  |  |  |
|-----------|--|-----|----|-----|-----|-----|--|--|--|--|--|--|
| Antenna   | Antenna Rear Front Top side Bottom side Right side Left side |     |    |     |     |     |  |  |  |  |  |  |
| WWAN      | Yes  | Yes | No | Yes | Yes | Yes |  |  |  |  |  |  |
| WIFI / BT | WIFI/BT Yes Yes Yes No Yes No                                |     |    |     |     |     |  |  |  |  |  |  |

General note:

Referring to KDB941225 D06, when the overall device length and width are >9cm\*5cm, the test distance is 10mm. SAR must be measured for all sides and surfaces with a transmitting antenna located within 25mm from that surface or edge.

1. According to the above table, the initial test position for body is "Rear", and its reported SAR is≤ 0.4W/kg. Thus further SAR measurement is not required for the other (remaining) test positions. Because the reported SAR of the highest measured maximum output power channel for the exposureconfiguration is ≤ 0.8W/kg, no further SAR testing is required for 802.11b DSSS in that exposureconfiguration.

 When SAR measurement is required for 2.4 GHz 802.11g/n OFDM configurations, the measurement and test reduction procedures for OFDM are applied. SAR is not required for the following 2.4 GHz OFDM conditions.

a) When KDB Publication 447498 D01 SAR test exclusion applies to the OFDM configuration.

b) When the highest *reported* SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg. the 802.11g/n is not required

Note:

According to the KDB248227 D01, The reported SAR must be scaled to 100% transmission duty factor to determine compliance at the maximum tune-up tolerance limit. A maximum transmission duty factor of 100% is achievable for WLAN in this project.

SAR Test Data Plots to the Appendix A.

## 15. Simultaneous Transmission analysis

General note:

1. WLAN and Bluetooth share the same antenna, and cannot transmit simultaneously.

2. EUT will choose either GSM or WCDMA according to the network signal condition; therefore, they will not operate simultaneously at any moment.

3. The reported SAR summation is calculated based on the same configuration and test position

4. For simultaneous transmission analysis, Bluetooth SAR is estimated per KDB 447498 D01 based on the formula below

a) [(max. Power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] \* [√f(GHz)/x]W/kg for test separation distances ≤50mm; whetn x=7.5 for 1-g SAR, and x=18.75 for 10-g SAR.

b) When the minimum separation distance is <5mm, the distance is used 5mm to determine SAR test exclusion

c) 0.4 W/kg for 1-g SAR and 1.0W/kg for 10-g SAR, when the test separation distances is >50mm.

| Bluetooth | Exposure position    | Head  | Body-worn |
|-----------|----------------------|-------|-----------|
| Max power | Test separation      | 0mm   | 10mm      |
| 7.50 dBm  | Estimated SAR (W/kg) | 0.235 | 0.117     |
