2.1. EUT description

The EUT is a triple band (900MHz/1800MHz/1900MHz) GSM / GPRS mobile phone with a camera and supporting bluetooth.

The EUT was not modified during the tests.

3. EUT Test Setup

For each test the EUT was exercised to find the worst case of operation modes and device configuration.

4. Applicable Standards

The tests were performed in guidance of CFR 47, part 24 and part 2, ANSI/TIA/EIA-603-A and RSS-133. Deviations, modifications or clarifications (if any) to above mentioned documents are written in each section under "Test method" for each test case.

5. Radiated RF output

RSS-133 section	6.2		
Measured by	Jesper Nielsen		

5.1. Test setup

The EUT was set on a non-conductive turn table, 80 cm high, in a semi-anechoic chamber with a reflective ground plane. In the corner of the chamber was a communication antenna, which was connected to the BS simulator located in the operators control room. The radiated power from the EUT was measured with an antenna fixed to a antenna tower. The tower and turn table were remotely controlled to turn the EUT, change the antenna polarization and hoist/lower the antenna. The scan height was from 1 to 4 meter. The measured signal was routed from the measuring antenna to the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns. The measuring distance was 3 meter.

5.2. Test method

The maximum power level was searched by moving the turn table and the measuring antenna and manipulating the EUT. The measurement was recorded. The worst case radiated power (EIRP) was then calculated on the basis of a pre-calibrated powersubstitution measurement and reported.

5.3. EUT operation mode

8.1. Test setup

A set of LP/HP/BS filters was used to prevent overloading the spectrum analyzer. The BS simulator was used to set the TX channel and power level and modulate the TX signal with different bit patterns. The test was done manually.

8.2. Test method

- The emissions were searched and maximized by moving the turn table and measuring antenna and manipulating the EUT.
- All suspicious frequencies with emission levels were recorded.
- The EUT was replaced with a substituting antenna.
- For each frequency recorded, the substituting antenna was fed with the power (from signal generator) giving the same reading as in (b). These power levels were reported.

8.3. EUT operation mode

	GSM/GPRS
EUT operation mode	TX on, 1 time slot transmission GPRS TX on, x time slot transmission
EUT channel	661
EUT TX power level	Maximum

8.4. Limit

Frequency [MHz]	Level [dBm]
30 – 19100	-13

8.5. Results

The formula below was used to calculate the EIRP of the spurious emissions. If there were no emissions closer than 20dB below the limit line, then the emission levels were documented only at the transmitter's mid-channel harmonics.

$$P_{\text{Emission}}[\text{dBm}] = P_{\text{SubstTX}}[\text{dBm}] - L_{\text{Cable}}[\text{dB}] + G_{\text{Antenna}}[\text{dBi}]$$

where the variables are as follows:

$P_{\text{Measured}}[\text{dBm}]$	Measured emission level (from step b in 8.2)
$P_{\text{Subst_TX}}[\text{dBm}]$	Signal generator power (from step d in 8.2) fed to the substituting antenna
$L_{\text{Cable}}[\text{dB}]$	Loss of the cable between antenna and signal generator (from step d in 8.2)
$G_{\text{Antenna}}[\text{dBi}]$	Gain of the substitutive antenna over isotropic radiator

9.4. Test method

- a) The EUT was placed in the chamber
- b) The climate chamber temperature was set to the maximum value (50°C) and the temperature was allowed to stabilize for 45 minutes
- c) The EUT was set to transmit.
- d) The transmit frequency error was measured after 1 minute
- e) The call was released
- f) Temperature decreased 10 °C and allowed to stabilize for 45 minutes after set temperature was reached
- g) The steps c – f were repeated
