

Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at the antenna terminal: 29.90 (dBm)

Maximum peak output power at the antenna terminal: 977.24 (mW)

Antenna gain(typical): 6 (dBi)

Maximum antenna gain: 3.981071706 (numeric)

Prediction distance: 23 (cm)

Prediction frequency: 900 (MHz)

MPE limit for uncontrolled exposure at prediction frequency: 0.6 (mW/cm²)

Power density at prediction frequency: **0.585241** mW/cm²)

Therefore device complies with FCC and Industry Canada RF radiation exposure limits for general population as a mobile device at 23cm separation distance or higher
