Model differences

This letter is a declaration of the differences between model GS025 & GS085.

The GS085 circuit has a jumper on JP1 to configure the firmware as an anti-two-block. If the jumper is not there, the firmware is configured as a wind speed sensor.

The enclosure shape is different. GS025 enclosure has to support wind cup rotor to measure the wind speed; GS085 enclosure has to support a piston mechanism for detecting two-block alarm.

The function is different: GS025 is a wind speed sensor; GS085 is an anti-two-block sensor.
