RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances≤ 50 mm are determined by:

| [(max. power of channel, including tune-up tolerance, mW)/(min. test separation |
|---|
| distance, mm)] • [√ f(GHz)] ≤ 3.0 for 1-g SAR and ≤ 7.5 for 10-g extremity |
| SAR, where |
| f(GHz) is the RF channel transmit frequency in GHz |
| ☐ Power and distance are rounded to the nearest mW and mm before |
| calculation |
| ☐ The result is rounded to one decimal place for comparison |
| Worse case is as below: [2402 MHz -4.372dBm (0.365 mW) output power] |
| (0.365 mW /5mm) • [√ 2.402 (GHz)]= 0.113 <3.0 for 1-g SAR |
| Then SAR evaluation is not required |
