

5.2.6. Transmitter Band Edge Radiated Emissions (5.25-5.35 GHz Band)**Test Summary:**

Test Engineer:	Georgios Vrezas	Test Dates:	27 June 2015 to 02 July 2015
Test Sample Serial Number:	F50980BB0152		

FCC Reference:	Parts 15.407(b)(2) & 15.209(a)
Test Method Used:	ANSI C63.10 Section 6.10 & FCC KDB 789033 Section II.G

Environmental Conditions:

Temperature (°C):	23 to 27
Relative Humidity (%):	36 to 49

Note(s):

1. All modes were initially tested and QPSK was found to produce the widest bandwidth, band edge tests were performed in this mode. The EUT was transmitting with >99% duty cycle and at maximum power for bottom or top channel according to the antenna being used (refer to Section 4.2). All antennas types were tested. The EUT was connected to each antenna using the supplied RF cables.
2. Lower band edge measurements were performed with the EUT transmitting on the bottom channel of the 5.25-5.35 GHz band. The lower band edge plots show a frequency line at 5.15 GHz. A restricted band of operation exists from 4.5 GHz to 5.15 GHz. A peak limit of 74 dB μ V/m and an average limit of 54 dB μ V/m applies in the restricted band. Field strength tests were performed at a measurement distance of 3 metres. Markers were placed on the peak and average traces at 5.15 GHz.
3. Upper band edge measurements were performed with the EUT transmitting on the top channel of the 5.25-5.35 GHz band. The upper band edge plots show an upper band edge frequency line at 5.35 GHz. A restricted band of operation exists from 5.35 GHz to 5.46 GHz. A peak limit of 74 dB μ V/m and an average limit of 54 dB μ V/m applies in the restricted band. Field strength tests were performed at a measurement distance of 3 metres. Markers were placed on the peak and average traces at the band edge frequency of 5.35 GHz.
4. The blue trace on the result plots shows the peak level and the black trace shows the average level.

5.2.7. Transmitter Band Edge Conducted Emissions (5.47-5.725 GHz Band)**Test Summary:**

Test Engineer:	Georgios Vrezas	Test Dates:	16 July 2015 to 27 July 2015
Test Sample Serial Number:	F50980BB0152		

FCC Reference:	Parts 15.407(b)(3) & 15.209(a)
Test Method Used:	ANSI C63.10 Section 6.10, FCC KDB 789033 Section II.G and Notes below

Environmental Conditions:

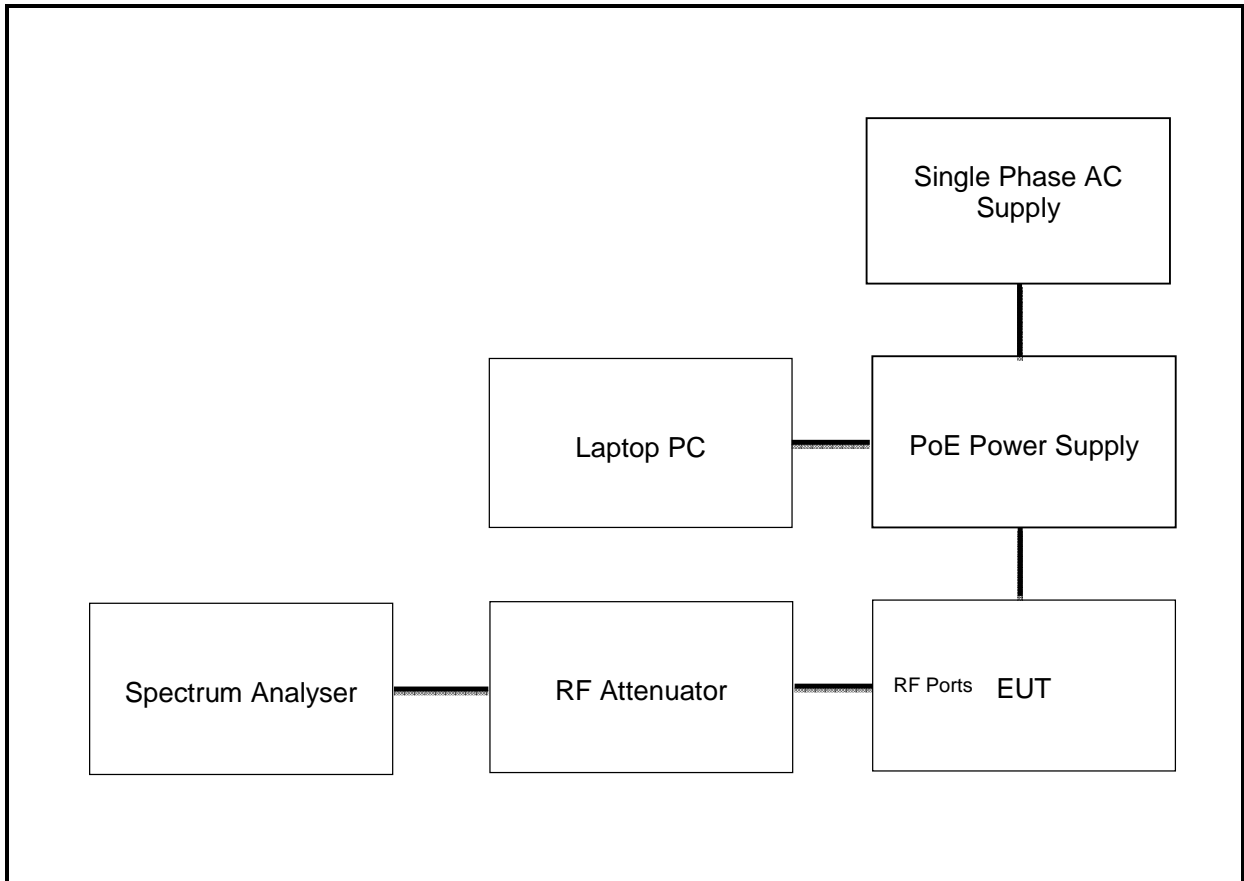

Temperature (°C):	24 to 25
Relative Humidity (%):	44 to 54

Note(s):

- Band edge tests were performed as conducted measurements in the operating mode that produced the highest emission levels at band edges. All modes were initially tested and the mode that produced the highest levels was QPSK. The EUT was transmitting with >99% duty cycle and at maximum power for bottom or top channel according to the antenna being used (refer to Section 4.2 of this test report). All antennas types were tested. The test receiver was connected to the RF port on the EUT using a 3 dB attenuator and RF cable. The total attenuation appears on the result plots as an RF level offset.
- Measurements were performed on both RF ports. The results were linearly combined in accordance with FCC KDB 662911 Section E.2(a)(ii). The stated antenna gain was added to the combined conducted emission level and the result was compared with the limit to obtain the margin.
- Lower band edge measurements were performed with the EUT transmitting on the bottom channel. The lower band edge plots show a lower band edge frequency line at 5.47 GHz. A non-restricted band of operation exists adjacent to and below the lower band edge and the general limit of -27 dBm/MHz E.I.R.P. applies. A restricted band of operation exists 10 MHz below the lower band edge at 5.35 GHz to 5.46 GHz. The lower band edge field strength plots show a frequency line at 5.46 GHz and an average trace is shown (the lower of the two traces) with an associated frequency line and marker at 5.46 GHz. Spurious emissions found in the 5.35 GHz to 5.46 GHz restricted band are shown in the Transmitter Out of Band Radiated Emissions section of this test report.
- Upper band edge measurements were performed with the EUT transmitting on the top channel. The upper band edge plots show an upper band edge frequency line at 5.725 GHz. A non-restricted band of operation exists adjacent to and above the upper band edge and the general limit of -27 dBm/MHz E.I.R.P. applies.
- *In accordance with FCC KDB 789033 Section II.G.3(d)(ii), the integration method was used to show compliance. The channel power function of a test receiver was used to perform the measurements in a 1 MHz bandwidth. The measurement was centred 500 kHz below the lower band edge (5469.5 MHz) and 500 kHz above the upper band edge (5725.5 MHz). The test receiver was left to sweep for a sufficient period of time on MAX HOLD until the emission levels were maximised.

5.2.8. Transmitter Power Control**Test Summary:**

Test Engineer:	Georgios Vrezas	Test Date:	09 July 2015
Test Sample Serial Number:	F50980BB016F		

FCC Reference:	Part 15.407(h)
Test Method Used:	FCC KDB 789033 D01 Section II.E.3.a) Method PM

Environmental Conditions:

Temperature (°C):	24
Relative Humidity (%):	34

Note(s):

1. Transmitter power control tests were performed as the maximum E.I.R.P. is greater than 500 mW.
2. Tests were performed with the EUT transmitting from the highest configurable RF power to the lowest configurable RF power. The EUT graphical user interface was used to configure the power in step increments of 1.
3. All conducted power measurements were made using an RF average power meter in accordance with FCC KDB 789033 Section II.E.3.a) Method PM. Power was measured on both RF ports. The power was combined. This test has no limit. The test was performed to prove control of the RF output power.

6. Measurement Uncertainty

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
AC Conducted Spurious Emissions	0.15 MHz to 30 MHz	95%	±4.69 dB
Conducted Output Power	5.25 GHz to 5.725 GHz	95%	±0.76 dB
Power Spectral Density	5.25 GHz to 5.725 GHz	95%	±1.13 dB
Occupied Bandwidth	5.25 GHz to 5.725 GHz	95%	±3.92 %
Radiated Spurious Emissions	30 MHz to 1 GHz	95%	±5.65 dB
Radiated Spurious Emissions	1 GHz to 40 GHz	95%	±2.54 dB

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.
