# **1.** Summary of test results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests.

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The presented <u>Equipment Under Test</u> (in this report, hereinafter referred as EUT) supports radiofrequency technologies with WLAN technology and operating frequency range at 2.412 to 2.472 GHz according to IEE 802.11b/g/n. Other implemented wireless technologies were not considered within this test report.

Following test cases have been performed to show compliance with valid Part 15.207/15.209/15.247 of the FCC CFR Title 47 Rules, Edition 4<sup>th</sup> November 2015 and IC RSS-247 Issue 1/RSS-Gen Issue 4 standards.

### 3.2. IEEE 802.11 OVERVIEW: MODULATION AND DATA RATES

The modulations and data rates defined for 802.11 b/g/n transmitters are identified in the table below. Also it shows which operational mode is possible for the device under test (EUT) according applicant's information.

| 802.11b-Mode (DSSS System) |  |                  |  |  |
|----------------------------|--|------------------|--|--|
| Data rate [MBps]           | Modulation type                                    | Supported by EUT |  |  |
| 1                          | DBPSK (Differential binary phase shift keying)     | YES              |  |  |
| 2                          | DQPSK (Differential quadrature phase shift keying) | YES              |  |  |
| 5.5 / 11                   | CCK/PBCC (8-chip complementary code keying)        | YES              |  |  |
| 22                         | ERP-PBCC (Packet binary convolutional coding)      | YES              |  |  |

| 802.11g-Mode (OFDM system) |                                |                  |  |  |
|----------------------------|--------------------------------|------------------|--|--|
| Brutto data rate [MBps]    | Modulation type of subcarriers | Supported by EUT |  |  |
| 6/9                        | BPSK                           | YES              |  |  |
| 12 /18                     | QPSK                           | YES              |  |  |
| 24 / 36                    | 16-QAM                         | YES              |  |  |
| 48 / 54                    | 64-QAM                         | YES              |  |  |

Remark: 52 sub-carriers which can be modulated at different data-rates.

| 802.11 <b>n</b> -Mode (OFDM)              |                  |                  |
|---|------------------|------------------|
| Brutto data rate [MBps]                   | Modulation type  | Supported by EUT |
| 7.2/14.4/21.7/28.9/43.3/57.8/65/72.2 Mbps | HT20 (MCS0MCS7)  | YEW              |

### 4.2. Test system set-up for radiated magnetic field measurements below 30 MHz

Specification:

ANSI C63.10-2013 chapter 6.4 (§6.4.4.2)

**General Description:** Evaluating the radiated field emissions are done first by an exploratory emission measurement and a final measurement for most critical frequencies determined.

The loop antenna was placed at 1 m height above ground plane and 3 m measurement distance from set-up for investigations. Because of reduced measurement distance, correction data were applied, as stated in chapter "General Limit - Radiated field strength emissions below 30 MHz". The tests are performed in the semi anechoic room recognized by the regulatory commission.

Signalling unit (if needed)

#### 

Testing method:

#### Exploratory, preliminary measurement

Power supply (if needed)

The EUT and it's associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (step 90°, range 0° to 360°) and the EUT itself either on 3-orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT), the emission spectrum was recorded. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a data reduction table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position).

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

| Formula: | $E_C = E_R + AF + C_L + D_F - G_A$                               | AF =Antenna factor                               |
|----------|--|--|
|          |  | $C_L = Cable loss$                               |
|          | $\mathbf{M} = \mathbf{L}_{\mathbf{T}} - \mathbf{E}_{\mathbf{C}}$ | D <sub>F</sub> = Distance correction factor      |
|          |  | $E_C = Electrical field - corrected value$       |
|          |  | $E_R = Receiver reading$                         |
|          |  | G <sub>A</sub> = Gain of pre-amplifier (if used) |
|          |  | $L_{T} = Limit$                                  |

M = Margin

All units are dB-units, positive margin means value is below limit.

**Distance correction:** 

Reference for applied correction (extrapolating) factors due to reduced measurement distance: ANSI C63.10:2013, 6.4.4.2 - Equations (2) + (3) + (4)

### 4.3. Test system set-up for radiated electric field measurement 30 MHz to 1 GHz

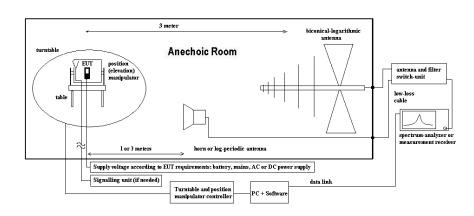

#### Specification:

ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5

General Description:

Evaluating the field emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the regulatory commissions.

#### Schematic:

#### Testing method: Exploratory, preliminary measurements

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to  $360^\circ$ , step 90°) and the EUT itself either on 3orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMIreceiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

#### Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semianechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

Formula:
$$E_C = E_R + AF + C_L + D_F - G_A$$
 (1) $AF = Antenna factor$   
 $C_L = Cable loss$  $M = L_T - E_C$ (2) $D_F = Distance correction factor (if used)$   
 $E_C = Electrical field - corrected value$ 

 $E_R = Receiver reading$ 

 $G_A = Gain of pre-amplifier (if used)$ 

$$L_T = Limit$$

M = Margin

All units are dB-units, positive margin means value is below limit.

### 4.4. Test system set-up for radiated electric field measurement above 1 GHz

#### Specification:

ANSI C63.4-2014 chapter 8.3, ANSI C63.10-2013 chapter 6.6.3.3 & 6.6.4

**General Description:** Evaluating the emissions have to be done first by an exploratory emissions measurement and a final measurement for most critical frequencies. The tests are performed in a CISPR 16-1-4:2010 compliant fully anechoic room (FAR) recognized by the regulatory commission. The measurement distance was set to 3 meter for frequencies up to 18 GHz and 2 meter above 18 GHz. A logarithmic periodic antenna is used for the frequency range 30 MHz to 1 GHz. Horn antennas are used for frequency range 1 GHz to 40 GHz. The EUT is aligned within 3 dB beam width of the measurement antenna with three orthogonal axis measurements on the EUT.

#### **Schematic:** 3 meter Log.per. dipol antenna turntable Anechoic Room osition antenna and filte switch-unit . (elevation) nanipulato low-loss cable specta horn or log.-periodic antenna 1 or 3 meter Supply voltage according to EUT requirements: batterie, mains, AC or DC power supply Signalling unit (if needed) data link furntable and positio nanipulator controlle PC + Software

#### Exploratory, preliminary measurements **Testing method:** The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 1.55 m height which is placed on the turntable. By rotating the turntable (range $0^\circ$ to 360°, step 15°) and the EUT itself either on 3orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMIreceiver. broadband antenna and software. The measurements are performed in horizontal and vertical polarization of the measurement antennas. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions. Formula: $E_C = E_R + AF + C_L + D_F - G_A \quad (1)$ M = Margin $M = L_T - E_C$ (2)

#### Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined. Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself over 3-orthogonal axis and the height for EUT with large dimensions.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out. On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

(1)  $E_{C} = Electrical field - corrected value$  $E_{R} = Receiver reading$ M = Margin $L_{T} = Limit$ AF = Antenna factor $C_{L} = Cable loss$  $D_{F} = Distance correction factor (if used)$ 

 $G_A = Gain of pre-amplifier (if used)$ 

All units are dB-units, positive margin means value is below limit.

Method of measurement:

 $\blacksquare$  conducted  $\square$  radiated

#### A special firmware program is used for test purposes. In opposite to normal operating mode a higher dutycycle is set in order to facilitate the measurements. This is maximized at the extent possible.

The necessary duty-cycle correction factor is determined on nominal conditions on middle channel only. It is assumed that no noticeable changes occur when tested on other channels or climatic conditions. The Duty-Cycle was constant, means without variations. Minimum and maximum modulation index was tested, the duty cycle is to be found therefore between a minimum and maximum values.

#### **Results:**

Remark<sup>1)</sup>: Measured duty cycle value is lower than the marker uncertainty therefore this measurement can be neglected.

Calculated with following formulas:

| Duty cycle: $x = \frac{Tx_{on}}{Tx_{on} + Tx_{off}}$ | Duty cycle factor [dB]: $10\log\left(\frac{1}{x}\right)$ |  |
|--|--|--|
|--|--|--|

The results were corrected in order to evaluate for worst-case result each time when average values are necessary for example average radiated emissions or similar.

| ANSI          | 🗷 ANSI 63.10:2013  |
| Specification | For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt. As<br>an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the<br>maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered<br>to all antennas and antenna elements averaged across all symbols in the signalling alphabet when the transmitter is<br>operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The<br>average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power<br>level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output<br>power is the highest total transmit power occurring in any mode. |

#### 5.2.3. EUT settings:

The EUT was instructed to send with maximum power (if adjustable) according applicants instructions. Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

#### 5.2.4. Test condition and measurement test set-up

#### 5.2.6. RESULTS

#### APLICANT'S DECLARED ANTENNA CHARACTERISTICS:

Directional Gain < 6 dBi (measured: difference between measured conducted and radiated eirp. power)

Directional Gain > 6 dBi (measured / applicant's declaration) -> conducted power reduction necessary

• Maximum declared antenna gain [isotropic]: 5 dBi

Different modulation types and data rates were tested in order to find the maximum peak conducted output power. **Enclosed are only the maximum values for each modulation format**, pls. compare separate document A1 for all results.

| Max. Peak power (conducted)<br>[dBm] |                         |                      |                     |  |  |  |  |

#### 5.3.2. REFERENCES: §15.247(e), RSS-247, Chapter 5.2(2)

(e) For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

#### §15.247(a)(2), RSS-247, Chapter 5.2(1); RSS-Gen Issue 4: Chapter 4.6.2

(1) <u>Frequency hopping systems</u> shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than  $125 \, mW$ 

(2) DSSS Systems using digital modulation techniques may operate in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

#### 3 Test condition and massurement test set

#### 5.4.4. EUT Settings:

The EUT was instructed to send with maximum power (if adjustable) according applicants instructions. Different modulation characteristics have been checked, e.g. data rates which EUT can operate.

#### 5.4.5. Measurement method:

Three carrier frequencies (low/middle/high) were used for showing the compliance with this requirement. A DELTA Marker method was set to measure the bandwidth compared to the highest In-Band power. The operating modes have been varied (e.g. data rate, modulation scheme, etc.). If applicable the hopping-mode is switched off.

Also the 99% emission bandwidth was measured. Two markers are placed on frequency points such that left to lower f-marker and right to higher f-marker only 1% of the TX-power is contained. Between the markers, 99% of the power is laying. The RBW value is readjusted and the measurement repeated until the RBW/EBW ratio is around 1%.

| Span                  | Set as to fully display the emissions $+30\%$  |
|-----------------------|--|

### 5.5.4. EUT SETTINGS

For FHHS-systems hopping mode was switched-off so fixed three different channels could be measured. The EUT was instructed to send with maximum power (if adjustable) according to applicants instructions.

#### 5.5.5. MEASUREMENT METHOD

According guidance 558074 D01 measurement DTS guidance V03r05: the frequency spectrum was investigated for conducted spurious emissions values lower than 20dB related to the RF-carrier power value. Three carrier frequencies (low/middle/high channel) were used for showing the compliance with this requirement. First a In-Band Reference level measurement of the carrier was performed. The video bandwidth (VBW) was chosen 10 times the resolution bandwidth (RBW). The frequency scan was up to 10 times the highest channel frequency within the operational mode. The spectrum-analyzer was set to MAX-PEAK Detector, MAX-Hold Mode, trace stabilisation mode.

### 5.5.6. TABLE OF MEASUREMENT RESULTS:

#### 5.6.4. Measurement Results

The results are presented below in summary form only. For more information please consult the diagrams included in annex 1.

The EUT is put on operation on middle channel only. If critical peaks are found (Margin <10 dB) the lowest and highest channels will be performed too. For more information please see the diagrams.

Table of measurement results:

#### 5.6.5. Correction factors due to reduced meas. distance (f< 30 MHz)

The used correction factors when the measurement distance is reduced compared to regulatory measurement distance, are calculated according Extrapolation formulas valid for EUT's with maximum dimension of 0.625xLambda. Formula 2+3+4 as presented in ANSI C63.10, Chapter 6.4.4 are used for the calculations of proper extrapolation factors.

| Frequency<br>-Range | f [kHz/MHz]          | Lambda (m)         | Far-Field<br>Point [m] | Distance Limit<br>accord. 15.209 [m] | 1st Condition<br>(dmeas<<br>D <sub>near-field</sub> ) | 2'te Condition<br>(Limit distance<br>bigger d <sub>near-field</sub> ) | Distance Correction<br>accord. #### 5.9.4. Measurement Method

For <u>uncritical results</u> where a measurement resolution bandwidth of 1MHz can clearly show the compliance without influencing the results, a field strength measurement was performed to show compliance.

For <u>critical results</u> a Marker-Delta marker method was used for showing compliance to restricted bands. The method is according ANSI C63.10:2013, Chapter 6.10.6 "Marker-Delta method",. The method consists of three independent steps:

- **1. Step:** Prior to the measurement the fundamental radiated In-Band field strength was performed. The determined value is used as reference value.
- **2. Step**: Second step consist of finding the relative attenuation between the fundamental emission and the maximum local out-of-band emission (within 2 MHz range around the band edge either on the band-edge directly or some modulation product if the level is greater than that on the band-edge) when measured with lower resolution bandwidth.
- **3. Step:** The delta value recorded in step 2 will be subtracted from value recorded in step 1, thus giving the required field strength at the band-edge. This value must fulfil the requirements for radiated spurious emissions in restricted bands in FCC §15.205 or RSS-Gen, Issue 4, Chapter 8.10, Table 6 with the general limits of FCC §15.209 or RSS-Gen, Issue 4 Chapter 8.9, Table 4.

#### 5.9.5. EUT settings

The EUT was instructed to send with maximum power (if adjustable) according to applicants instructions.

#### 5.9.6. Results: for non-restricted bands near-by

#### 5.9.6.1. Non-restricted bands near-by - limits according FCC §15.247 and RSS-247, Issue 1, Chapter 5.5

Remark: Refer chapter 5.1 for applicable duty-cycle correction factor for AV value maximum 0.6 dB additional to be considered on n-Mode modulation

5.9.7. Verdict: passed

### **5.10.** Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor  $\mathbf{k}$ , such that a confidence level of approximately 95% is achieved. For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

| RF-Measurement                               | Reference    | Frequency range                     | Ca               | Calculated uncertainty based on a confidence level of 95% |         |          |      |         | Remarks             |
