## Note2:

The PoE is for measurement only, would not be marketed.
The PoE information as below:

| Power | Brand | Model |
| :---: | :---: | :---: |
| PoE | Microsemi | PD-9001GR |

Note3: All the specification of test configurations and test modes were based on customer's request.
Note4: The console port can not be used by end user. It is generally used for updating FW by professional installer.

The following test modes were performed for all tests:
For Conducted Emission test:
Mode 1. Normal Link - EUT

## For Radiated Emission Below 1 GHz test:

The EUT 1 was performed at $Y$ axis and $Z$ axis position. $Z$ axis has been evaluated to be the worst case, thus measurement will follow this same test mode.

## Mode 1. Normal Link - Place EUT in Z axis

## For Radiated Emission Above 1 GHz test:

The EUT was performed at $Y$ axis and $Z$ axis position. $Y$ axis has been evaluated to be the worst case, thus measurement will follow this same test mode.

## Mode 1. CTX - Place EUT in Y axis

## For Co-location MPE and Radiated Emission Co-location Test:

The EUT could be applied with 2.4 GHz WLAN function and 5 GHz WLAN function; therefore Co-location Maximum Permissible Exposure (Please refer to FA640141-01) and Radiated Emission Co-location (please refer to Appendix B) tests are added for simultaneously transmit between 2.4 GHz WLAN function and 5 GHz WLAN function.

2. Connect EUT or host of EUT to the power mains through a line impedance stabilization network (LISN).
3. All the support units are connected to the other LISNs. The LISN should provide $50 \mathrm{uH} / 50 \mathrm{ohms}$ coupling impedance.
4. The frequency range from 150 kHz to 30 MHz was searched.
5. Set the test-receiver system to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

### 4.5.3. Test Procedures

1. Configure the EUT according to ANSI C63.10. The EUT was placed on the top of the turntable 1.5 meter above ground. The phase center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 1 m \& 3 m far away from the turntable.
2. Power on the EUT and all the supporting units. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
3. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emissions field strength of both horizontal and vertical polarization.
4. For each suspected emissions, the antenna tower was scan (from 1 m to 4 m ) and then the turntable was rotated (from 0 degree to 360 degrees) to find the maximum reading.
5. Set the test-receiver system to Peak or CISPR quasi-peak Detect Function with specified bandwidth under Maximum Hold Mode.
6. For emissions above 1 GHz , use 1 MHz VBW and 3 MHz RBW for peak reading. Then 1 MHz RBW and $1 / T$ VBW for average reading in spectrum analyzer.
7. If the emissions level of the EUT in peak mode was 3 dB lower than the average limit specified, then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions which do not have 3 dB margin will be repeated one by one using the quasi-peak method for below 1 GHz .
8. For testing above 1 GHz , the emissions level of the EUT in peak mode was lower than average limit (that means the emissions level in peak mode also complies with the limit in average mode), then testing will be stopped and peak values of EUT will be reported, otherwise, the emissions will be measured in average mode again and reported.
9. In case the emission is lower than 30 MHz , loop antenna has to be used for measurement and the recorded data should be QP measured by receiver. High - Low scan is not required in this case.

Note:
The amplitude of spurious emissions that are attenuated by more than 20 dB below the permissible value has no need to be reported.

Emission level $(\mathrm{dBuV} / \mathrm{m})=20$ log Emission level ( $\mathrm{uV} / \mathrm{m}$ ).
Corrected Reading: Antenna Factor + Cable Loss + Read Level - Preamp Factor = Level.

### 4.6. Emissions Measurement

4.6.1. Limit

30 dBc in any 100 kHz bandwidth outside the operating frequency band. In case the emission fall within the restricted band specified on 15.205(a), then the 15.209(a) limit in the table below has to be followed.

| :---: | :---: | :---: |
| $0.009 \sim 0.490$ | $2400 / \mathrm{F}(\mathrm{kHz})$ | 300 |

### 4.6.2. Measuring Instruments and Setting

Please refer to section 5 of equipments list in this report. The following table is the setting of the spectrum analyzer.

| Spectrum Parameter | Setting |
| :--- | :--- |
| Attenuation | Auto |
| Span Frequency | 100 MHz |
| RBW / VBW (Emission in restricted band) | $1 \mathrm{MHz} / 3 \mathrm{MHz}$ for Peak, |
|  | $1 \mathrm{MHz} / 1 / \mathrm{T}$ for Average |
| RBW / VBW (30dBc in any 100 kHz bandwidth emission) | $100 \mathrm{kHz} / 300 \mathrm{kHz}$ for Peak |

### 4.7. Antenna Requirements

### 4.7.1. Limit

Except for special regulations, the Low-power Radio-frequency Devices must not be equipped with any jacket for installing an antenna with extension cable. An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited. Further, this requirement does not apply to intentional radiators that must be professionally installed.

### 4.7.2. Antenna Connector Construction

Please refer to section 3.3 in this test report; antenna connector complied with the requirements.
