# **RSS 210, Issue 8 Test Report Cover Sheet**

This document provides supplemental information relating to the technical specifications of the product to be certified. This shall be completed in full and signed by the personnel responsible for the testing of the product. This form or the original from RSP-100 Appendix B may be used.

### 1. **PRODUCT DETAILS**

Equipment Model Number	NA0018
Manufacturer	Nike, Inc.
Tested to Radio Standards	RSS 210, Issue 8
Open Area Test Site Industry Canada	2040C
Frequency Range:	2402 – 2480 MHz
RF Power in Watts:	.00078
Field Strength (and at what distance):	N/A
Occupied Bandwidth (99% BW):	1.09 MHz
Type of Modulation:	GFSK
Emission Designator (TRC-43):	1M09G7W
Transmitter Spurious (worst case):	180 μV/m @ 3m
Receiver Spurious (worst case):	N/A

#### 2. ATTESTATION

DECLARATION OF COMPLIANCE: I declare that the testing was performed or supervised by me; that the test measurements were made in accordance with the above-mentioned Industry Canada standard(s); and that the equipment identified in this application has been subjected to all the applicable test conditions specified in the Industry Canada standards and all of the requirements of the standard have been met.

# **EUT Configuration**

A minimum representative configuration, as defined by the manufacturer, has been used for the testing performed herein. The selection of hardware (including interface ports), software, and cables were chosen by the manufacturer as being representative of the product's intended use. The interconnection of various articles of equipment and the types of cables used has also been defined by the manufacturer.

The placement of the equipment under test has been, to the extent practical, arranged to maximize emissions.

Cables, of the type and length specified by the manufacturer, were connected to at least one of each type of interface port provided by the EUT and if practical, were terminated by a device typical of actual usage. For multiple ports of the same type, the addition of cables did not significantly affect the emission level (i.e. < 2dB variation).

The arrangement of external power supply units was as follows:

- a) If the mains input cable of the external power supply unit is greater than 0,8 m, the external power supply unit shall be placed on the tabletop, with a nominal 0,1 m separation from the host unit.
- b) If the external power supply unit has a mains input cable that is less than 0,8 m, the external power supply unit shall be placed at a height above the ground plane such that its power cable is fully extended in the vertical direction.
- c) If the external power supply unit is incorporated into the mains power plug, it shall be placed on the tabletop. An extension cable shall be used between the external power supply unit and the source of power. The extension cable should be connected in a manner such that it takes the most direct path between the external power supply unit and the source of power.

# **Procedural Requirements**

The following requirements are taken from the appropriate rules, other rules may apply and the manufacturer should consult the full text of the appropriate laws prior to marketing any device.

## **United States**

Mandated procedures for digital devices are defined in 47 CFR 15.201, *Equipment authorization requirement*. Details of the authorization procedures (verification, declaration of conformity, and certification) can be found in 47 CFR, Part 2, Subpart J, *Equipment Authorization Procedures*.

## Canada

Industry Canada standard RSS-GEN and RSP 100 contain the procedural requirements.

# Information to the User and Labeling Requirements

The following requirements are taken from the appropriate rules, other rules may apply and the manufacturer should consult the full text of the appropriate laws prior to marketing any device.

### **United States**

#### Labelling

47 CFR 2.925(a) (1) Each equipment covered in an application for equipment authorization shall bear a nameplate or label listing the following: FCC Identifier consisting of the two elements in the exact order specified in §2.926. The FCC Identifier shall be preceded by the term *FCC ID* in capital letters on a single line, and shall be of a type size large enough to be legible without the aid of magnification.

FCC ID XXX123

Where XXX = Grantee Code

and 123 = Equipment Product Code (up to 14 characters)

47 CFR 15.19 (a) (3) In addition to the requirements in part 2 of this chapter, a device subject to certification, or verification shall be labeled as follows: All other devices shall bear the following statement in a conspicuous location on the device:

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

47 CFR 15.19(b)(2) Label text and information should be in a size of type large enough to be readily legible, consistent with the dimensions of the equipment and the label. However, the type size for the text is not required to be larger than eight point.

47 CFR 15.19(b)(3): When the device is so small or for such use that it is not practicable to place the statement specified under paragraph (b)(1) of this section on it, such as for a CPU board or a plug-in circuit board peripheral device, the text associated with the logo may be placed in a prominent location in the instruction manual or pamphlet supplied to the user. However, the unique identification (trade name and model number) and the logo must be displayed on the device.

47 CFR 15.19(b)(4): The label shall not be a stick-on, paper label. The label on these products shall be permanently affixed to the product and shall be readily visible to the purchaser at the time of purchase, as described in §2.925(d) of this chapter. "Permanently affixed" means that the label is etched, engraved, stamped, silkscreened, indelibly printed, or otherwise permanently marked on a permanently attached part of the equipment or on a nameplate of metal, plastic, or other material fastened to the equipment by welding, riveting, or a permanent adhesive. The label must be designed to last the expected lifetime of the equipment in the environment in which the equipment may be operated and must not be readily detachable.

#### Information to User

47 CFR 15.21: The user's manual or instruction manual for an intentional or unintentional radiator shall caution the user that:

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

In cases where the manual is provided only in a form other than paper, such as on a computer disk or over the Internet, the information required by this section may be included in the manual in that alternative form, provided the user can reasonably be expected to have the capability to access information in that form.

## Canada

#### Labelling

<u>RSS</u> –GEN 5.2: Every unit of Category I radio apparatus certified for marketing and use in Canada shall bear a permanent label on which is indelibly displayed the model number and Industry Canada certification number of the equipment model (transmitter, receiver, or inseparable combination thereof). Each model shall be identified by a unique combination of a model number and a certification number, which are assigned as described

FCC Part 15, Subpart C & RSS 210, Issue 8 Report Number: trf\_195592\_FCC\_IC Revision: 0 Issue Date: 6-Jun-12

below in this section. The label shall be securely affixed to a permanently attached part of the device, in a location where it is visible or easily accessible to the user, and shall not be readily detachable. The label shall be sufficiently durable to remain fully legible and intact on the device in all normal conditions of use throughout the device's expected lifetime. These requirements may be met either by a separate label or nameplate permanently attached to the device or by permanently imprinting or impressing the label directly onto the device.

The label text shall be legible without the aid of magnification, but is not required to be larger than 8-point font size. If the device is too small to meet this condition, the label information may be included in the user manual upon agreement with Industry Canada.

The model number is assigned by the applicant and shall be unique to each model of radio apparatus under that applicant's responsibility. The model number shall be displayed on the label preceded by the text: "Model:", so it appears as follows:

Model: model number assigned by applicant

The certification number is made up of a Company Number (CN) assigned by Industry Canada's Certification and Engineering Bureau followed by the Unique Product Number (UPN), assigned by the applicant.

The certification number shall appear as follows:

IC: XXXXXX-YYYYYYYYYYY

where:

- XXXXXX-YYYYYYYYYY is the certification number;
- XXXXXX is the Company Number (CN) assigned by Industry Canada, made of at most 6 alphanumeric characters (A-Z, 0-9), including a letter at the end of the CN to distinguish between different company addresses;
- YYYYYYYYYY is the Unique Product Number (UPN) assigned by the applicant, made of at most 11 alphanumeric characters (A-Z, 0-9); and the letters "IC" (Industry Canada) are to indicate the Industry Canada certification number, but are not part of the certification number.

Permitted alphanumerical characters used in the CN and UPN are limited to capital letters (A-Z) and numerals (0-9). Example: A company has been assigned a CN of "21A" and wishes to use a UPN of "WILAN3" for one of its products. The full Industry Canada certification number of this product would thus be: IC: 21A-WILAN3.

# Category I equipment that is not labeled with the model number and the certification number as described above is not considered certified in Canada.

#### Notices to the User

<u>RSS-GEN 5.3</u>: Radio apparatus shall comply with the requirements to include required notices or statements to the user of equipment with each unit of equipment model offered for sale.

The required notices are specified in the RSS documents (including RSS-Gen) applicable to the equipment model. These notices are required to be shown in a conspicuous location in the user manual for the equipment, or to be displayed on the equipment model. If more than one notice is required, the equipment model(s) to which each notice pertains should be identified. Suppliers of radio apparatus shall provide notices and user information in both English and French.

<u>RSS-GEN 7.1.3:</u> User manuals for licence-exempt radio apparatus shall contain the following or equivalent notice in a conspicuous location in the user manual or alternatively on the device or both.

This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

User manuals for transmitters shall display the following notice in a conspicuous location:

Under Industry Canada regulations, this radio transmitter may only operate using an antenna of a type and maximum (or lesser) gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

User manuals for transmitters equipped with detachable antennas shall also contain the following notice in a conspicuous location:

This radio transmitter (*identify the device by certification number, or model number if Category II*) has been approved by Industry Canada to operate with the antenna types listed below with the maximum permissible gain and required antenna impedance for each antenna type indicated. Antenna types not included in this list, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Immediately following the above notice, the manufacturer shall provide a list of all antenna types approved for use with the transmitter, indicating the maximum permissible antenna gain (in dBi) and required impedance for each.

# **Technical Requirements**

The testing requirements, as appropriate, were derived from ANSI C63.4; 47 CFR, Subpart A; RSS 210; and RSS GEN.

## **Conducted Emissions**

The mains cable of the EUT or EUT host unit was connected to the LISN defined in this standard and is bonded to the reference plane. Where applicable, remaining auxiliary equipment was powered through an additional LISN (also bonded to the reference plane), using a multi-socket outlet strip if necessary. The LISNs were at least 0.8m away from the EUT. A vertical ground plane was used while the table-top EUTs were placed on a wooden table 0.8m high. Floor-standing EUTs were insulated from the ground plane and grounded according to the manufacturer's instructions.

Signal cables were positioned for their entire lengths, as far as possible, at a nominal distance of 0.4 m from the ground reference plane. Where the mains cable supplied by the manufacturer was longer than 1 m, the excess was folded at the center into a bundle no longer than 0.4 m, so that its length is shortened to 1 m. If the 1 m cable length cannot be achieved owing to physical limitations of the EUT arrangement, the cable length shall be as near to 1 m as possible.

All telecommunication and signal ports were correctly terminated using either appropriate associated equipment or a representative termination during the measurement of the conducted disturbances at the

mains. If an ISN is connected to a telecommunications port during the measurement of conducted disturbances at the mains port, then the ISN receiver port was terminated in  $50\Omega$ . The ISNs were at least 0.8m away from the EUT.

## Mains

Any power cable(s) from the equipment under test that were directly connected to the AC Mains have been tested. In the event that the equipment under test had no direct connection to the Mains, that is, it was connected to a Host unit (example: USB powered); then conducted emissions was performed on the Mains of the Host unit. Battery powered equipment was not tested for conducted emissions; however, if the equipment makes provisions for connections to a battery charger that is connected to the Mains, then conducted emissions were performed on the battery charger.

	Limits (dBµV)	
Frequency	Quasi-peak	Average
150 kHz – 500 kHz	66 - 56	5-46
500 kHz – 5 MHz	56	46
5 MHz – 30 MHz 60 50		
NOTE 1: The lower limit shall apply at the transition frequency. NOTE 2: The limit decreases linearly with the logarithm of the frequency in the range 150 kHz to 500 kHz.		

Table 5 – Class B Conducted Emissions Limits - Mains
--

## **Radiated Emissions**

# **Restricted Bands**

The arrangement of the equipment is typical of a normal installation practice and as was practical, the arrangement was varied and emissions investigated for maximum amplitude. Final measurements were performed in a semi-anechoic chamber or on an open area test site (OATS). The equipment was rotated 360° and the antenna height has been varied between 1m and 4m. Measurements were taken at both horizontal and vertical antenna polarities. The receiver bandwidth was set to 120 kHz for measurements below 1 GHz, and 1 MHz for measurements above 1 GHz. A peak detector is used to detect an emission; a quasi-peak detector may be used to record a final measurement below 1 GHz and an average detector may be used above 1 GHz. An inverse proportionality factor of 20 dB/decade (10 dB) was used, as noted in 15.31(f)(1), to normalize the measured data to the specified test distance for determining compliance.

Operating frequency of intentional radiator	Lowest frequency searched	Highest frequency searched
Below 10 GHz	9 kHz or lowest operating frequency generated in the device, whichever is highest	10 <sup>th</sup> harmonic of highest fundamental frequency or 40 GHz, whichever is lower
10 – 30 GHz	9 kHz or lowest operating frequency generated in the device, whichever is highest	5 <sup>th</sup> harmonic of highest fundamental frequency or 100 GHz, whichever is lower
At or above 30 GHz	9 kHz or lowest operating frequency generated in the device, whichever is highest	5 <sup>th</sup> harmonic of highest fundamental frequency or 200 GHz, whichever is lower

216 MHz – 960 MHz	200	46.0	3
Above 960 MHz	500	54.0	3

Table 9 – Radiated Emissions Limits	per 47 CFR 15.209(a) & RSS-GEN 7.2.5

### 6 dB Occupied Bandwidth

15.247(a)(2) and RSS 210 A8.2(a) Systems using digital modulation techniques may operate in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

The 6 dB Occupied Bandwidth is measured at low, mid, and high channels and with each modulation mode.

Spectrum analyzer settings:	
Span:	~ 2 to 3 times the 6 dB bandwidth
Resolution (or IF) Bandwidth (RBW):	100 kHz
Video (or Average) Bandwidth (VBW):	100 kHz
Sweep:	Auto
Detector Function:	Peak
Trace:	Max Hold

#### **RF Peak Output Power**

15.247(b)(3) and RSS 210 A4(4) For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt.

EUT test mode: The peak rf output power shall be measured at low, mid, and high channels and for each modulation mode.

EUT configuration:	Transmit at low, middle, and high channel with each modulation
Spectrum analyzer settings:	
Span	~5 times the 6 dB bandwidth
Resolution (or IF) Bandwidth (RBW):	> the 6 dB bandwidth of the emission being measured
Video (or Average) Bandwidth (VBW):	≥RBW
Sweep:	Auto
Detector Function:	Peak
Trace:	Max Hold

Alternative configuration: Alternatively the Channel Power measurement function of the spectrum analyzer may be used.

## **Spurious Emissions**

15.247(d) and RSS 210 A8.5: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits is not required. In addition, radiated emissions which fall in the restricted bands must also comply with the radiated emission limits specified.

EUT configuration:	Operate continuous transmit at maximum power
Spectrum analyzer settings:	
Span	Wide enough to capture the peak level of the in-band emission and all spurious emissions (e.g., harmonics) from the lowest frequency generated in the EUT up through the $10^{th}$ harmonic. Typically, several plots are required to cover this entire span.
Resolution (or IF) Bandwidth (RBW):	100 kHz
Video (or Average) Bandwidth (VBW):	≥RBW
Sweep:	Auto
Detector Function:	Peak
Trace:	Max Hold

# Band edge spurious emissions

EUT configuration:	Operate continuous transmit at maximum power
Measurement shall be made in these bands .:	2310 – 2390 MHz
	2483.5 – 2500 MHz
Span	Wide enough to capture the peak level of the emission operating on the channel closest to the band edge, as well as any modulation products which fall outside of the authorized band of operation
Resolution (or IF) Bandwidth (RBW):	$\geq$ 1% of the span
Video (or Average) Bandwidth (VBW):	≥ RBW
Sweep:	Auto
Detector Function:	Peak
Trace:	Max Hold

# **Measurement Uncertainty**

Determining compliance with the limits in these standards was based on the results of the measurement, and does not take into account the measurement instrumentation uncertainty.

Measurement	Expanded Uncertainty
Conducted Emissions – AC Mains	± 3.46 dB
Radiated Emissions	± 4.90 dB
RF Power – Antenna Conducted	± 1.34 dB
RF Spurious Emissions – Antenna Conducted	± 1.34 dB
Occupied Bandwidth	± 1.15 kHz

# List of Test Equipment

The following test equipment was used in the performance of the testing herein.

Asset Tag	Description	Manufacturer	Model	Serial Number	Cal. Date	Cal. Due

# **Test Results - RF Exposure**

### FCC Part 15, Subpart C & RSS 210, Issue 8 Report Number: trf\_195592\_FCC\_IC Revision: 0 Issue Date: 6-Jun-12

Table No. 20	Maximum Pormissible Exposure	Verdict
	Maximum Permissible Exposure	Р
Test Method	: ANSI C.95 and Safety Code 6	
EUT Exposure	Category Portable – Extremities	
Maximum rf out	put power(conducted): -1.1 dBm (0.776 mW)	
Evaluation Date	:: 10-Feb-12	
Antenna peak g	ain: 1.54 dBi	
Supplemental I	nformation:	
	SAR requirement is 60/f <sub>GHz</sub> mW	
60/2.48 GHz = 24		
	output power is less than 24.2 mW. Therefore the transmitter does not require SAR evaluation	1.
EIRP = -1.1 dBm	+ 1.54 dBi = 0.44 dBm (1.1 mW)	
	rn in a sports shoe and therefore is operated at a distance closer than 5 cm from the body. Ac Mobile Portable RF Exposure v03r03:	cording to
Body SAR is req to the body and t	uired for hand-held and hand-operated or wrist, feet and ankle worn devices that operate close he output power is > $300 \cdot [f(GHz)]^{-0.5}$ mW. At 2.480 GHz this threshold value would be 190.5 mV	r than 5 cm N.
Conclusion: Har Exposure v03r03	d and Body SAR are not required for this device according to FCC Bulletin D01 Mobile Portabl .	e RF
Tested by (+ sic	nature): David Light
