### 3. General test conditions

#### 3.1 Test setup during test

Radio setup

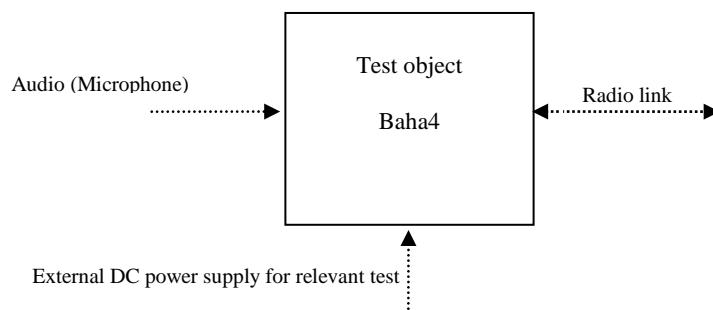

Figure 3.1.1 Block diagram of test object.

##### 3.1.1 Description and intended use of test object

Baha4 is a hearing instrument used for alleviation of hearing loss. It can receive audio signals and be configured via the radio link.

All hearing instruments are only powered from a zinc-air battery.

##### 3.1.2 Test modes during tests

All test objects were running special test software

During test, the test objects were in continuous Tx mode (normal modulation, normal data packets with optimised repetition rate).

Tests were performed at three frequencies for the radio:

- Low frequency: 2404 MHz
- Middle frequency: 2440 MHz
- High frequency: 2478 MHz.

During relevant tests the external DC power supply was used.

## 4. Test results

### 4.1 Duty cycle correction factor ( $\delta$ )

Test object	Baha4	Sheet	ANT-1
Type	Baha4	Project no.	T204709-3
Serial no.	3010120010191	Date	25 Feb. 2013
Client	Cochlear Bone Anchored Solutions AB	Initials	CMT
Specification	See Section 1, Summary of tests		

Test method	ANSI C63.10:2009	Temperature	23 °C
Characteristics	Test voltage: Zinc-air battery at 1.45 VDC	Humidity	21 % RH
Test equipm.	EMI room Hørsholm 49086 49600 49624 49625	Uncertainty	1.1 dB
SA Settings	RBW: 1 MHz VBW: 1 MHz SPAN: Zero-1ms DET: Peak CF: 2440 MHz Trace: Max Hold		

The duty cycle correction factor ( $\delta$ ) can be applied to the peak pulse amplitude to find the average emission (Max. 20 dB). This is valid for one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds.

The duty cycle correction factor is determined as follows:

The measured value for the duty cycle (D) is:

Max. Tx on time: 227.6 µs – Delta 3 (T1)

Period: 4916.0 µs – Delta 2 (T1).

The calculated duty cycle expressed in % is:

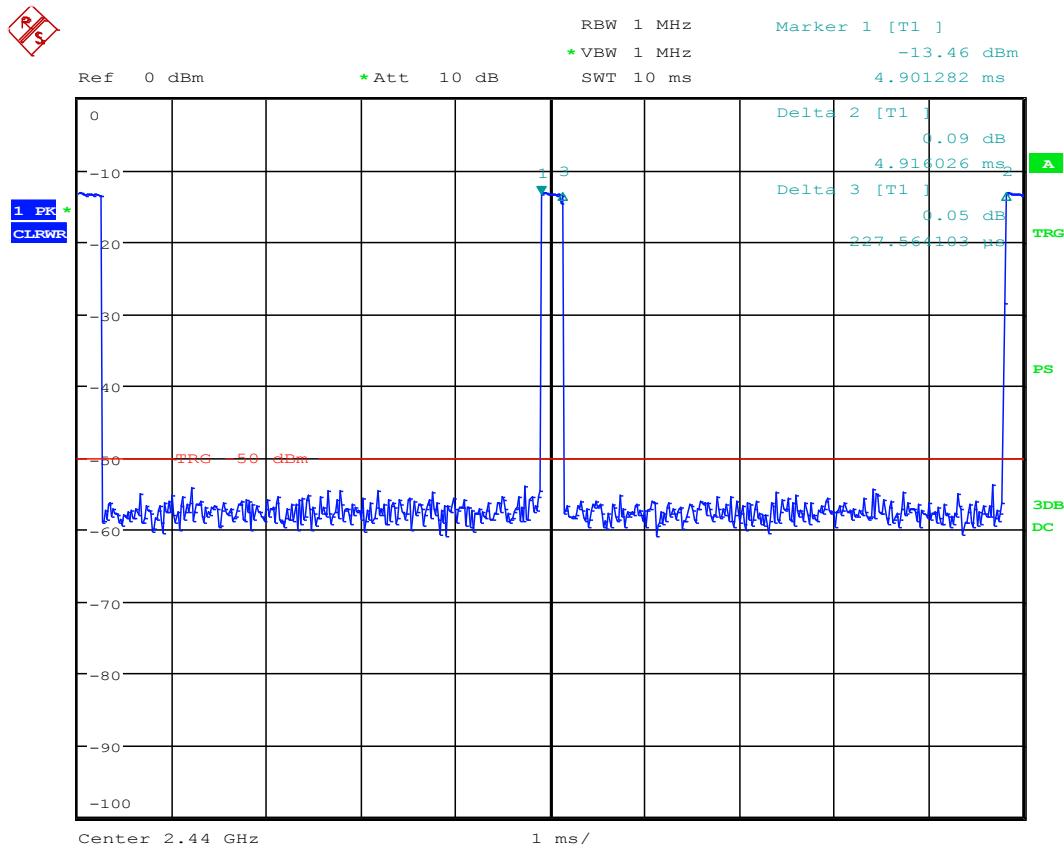

$$D(\%) = ((\text{Max. Tx on time}) \mu s / (\text{period}) \mu s) \cdot 100\% = 4.6\%.$$

The calculated duty cycle correction factor expressed in dB is:

$$\delta(\text{dB}) = 20 \log (\text{Max. Tx on time} (\mu s) / \text{period} (\mu s)) = 26.7 \text{ dB} \rightarrow 20 \text{ dB}.$$

According to ANSI C63.10.2009 (Section 4.2.3.2.4), FCC CFR 47 Part 15 Subpart C (Section 15.35(c)) and RSS-Gen (Section 4.5) this correction factor can be applied for all emissions including the fundamental and harmonics above 1 GHz and max. 20 dB.

The corrected average is: PAverage(resulting) = Ppeak + DCCF ( $\delta$ ).

### Transmitter out-of-band emission table

**Transmitter out-of-band Emission Table**

Project No.	T204709-3	Client	Cochlear Bone Anchored Solutions AB	Product	Baha4				
Specification:	FCC CFR 47 Part 15, Subpart C, §15.249	RSS-210, Issue 8:2010, A8.5							
Requirement:	All out-of-band emission shall be below the general limit (54 dBuV/m)								
The table below lists all out-of-band emissions exceeding the general emission limit of 500 uV/m (54 dBuV/m) as well as the measured in-band emissions for reference.									
The data is an extract of the measurement results reported in chapter 4 of the main report.
