RF exposure requirements - FCC ID: R43-RFBT

Dear Application Examiner,

The maximum measured power output is 1,22 mW (0,87 dBm), the maximum antenna gain is 3 dBi = numeric gain 1,99 (see also FCC test report)

The maximum permissible exposure is defined in 47 CFR 1.1310 with 1 mW/cm². The distance from the EUT's transmitting antenna where the exposure level reaches the maximum permitted level is calculated using the general equation:

$$S = P \cdot G / 4\pi R^2$$

$S_{\max} = 1\text{mW/cm}^2$, $P = 1,22 \text{ mW}$, linear power gain relative to the isotropic radiator = 3 dBi = 1,99 (numeric gain), R = distance in cm

Solving for R , the 1mW/cm² limit is reached in a distance of 0,43 cm to the transmitting antenna.

Please contact us if you have any additional questions.

Best Regards
