[Answers to the ATCB comments on the above referenced Application.](#)

1. Provide diagram and/or statement showing how the wireless device is considered a portable device.

Refer to “WBX2100 in Tote Photo” exhibit. This shows how the end user will install the wireless device. A medical technician can place the tote in one place or carry the tote around. The cover on the tote can be open during wireless transmission and the user can be closer than 20cm from the transmitting antenna. In this configuration there is a possibility that the antenna can be touched by the end user even though the user’s guide suggest not to do this.
