## **1 Test Laboratory**

### **1.1 Testing Location**

| Company Name: | TMC Beijing, Telecommunication Metrology Center of MIIT    |
|---------------|--|
| Address:      | No 52, Huayuan beilu, Haidian District, Beijing, P.R.China |
| Postal Code:  | 100191   |
| Telephone:    | +86-10-62304633  |
| Fax:          | +86-10-62304793  |

### **1.2 Testing Environment**

| Temperature:                | 18°C~25 °C,    |
|-----------------------------|----------------|
| Relative humidity:          | 30%~ 70%       |
| Ground system resistance:   | < 0.5 <b>Ω</b> |
| Ambient noise & Reflection: | < 0.012 W/kg   |

### 1.3 Project Data

| Project Leader:     | Qi Dianyuan   |  |
|---------------------|---------------|--|
| Test Engineer:      | Lin Xiaojun   |  |
| Testing Start Date: | July 10, 2013 |  |
| Testing End Date:   | July 11, 2013 |  |

### 1.4 Signature

Lin Xiaojun (Prepared this test report)

Qi Dianyuan (Reviewed this test report)

Xiao Li Deputy Director of the laboratory (Approved this test report)

## **2 Statement of Compliance**

The maximum results of Specific Absorption Rate (SAR) found during testing for TCT Mobile Limited GSM dual band mobile phone Tango Plus US / ALCATEL 2001A are as follows:

| Exposure Configuration     | Technology Band | Highest Reported SAR<br>1g (W/Kg) | Equipment Class |  |
|----------------------------|-----------------|-----------------------------------|-----------------|--|
| Head                       | GSM 850         | 0.64                              | PCE             |  |
| (Separation Distance 0mm)  | PCS 1900        | 1.26                              | FGE             |  |
| Body-worn                  | GSM 850         | 0.74                              | PCE             |  |
| (Separation Distance 10mm) | PCS 1900        | 1.28                              | FUE             |  |

#### Table 2.1: Highest Reported SAR (1g)

The SAR values found for the Mobile Phone are below the maximum recommended levels of 1.6 W/Kg as averaged over any 1g tissue according to the ANSI C95.1-1999.

For body worn operation, this device has been tested and meets FCC RF exposure guidelines when used with any accessory that contains no metal and which provides a minimum separation distance of 10 mm between this device and the body of the user. Use of other accessories may not ensure compliance with FCC RF exposure guidelines.

The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power output.

The measurement together with the test system set-up is described in annex C of this test report. A detailed description of the equipment under test can be found in chapter 4 of this test report. The highest reported SAR value is obtained at the case of **(Table 2.1)**, and the values are: **1.28 W/kg (1g)**.

|  | Position                | GSM  | BT*  | Sum  |
|--|-------------------------|------|------|------|
| Highest reported<br>SAR value for Head | Right hand, Touch cheek | 0.74 | 0.26 | 1.00 |
| Highest reported<br>SAR value for Body | Rear                    | 1.28 | 0.26 | 1.54 |

Table 2.2: The sum of reported SAR values for GSM and Bluetooth

BT\* - Estimated SAR for Bluetooth (see the table 13.2)

According to the above tables, the maximum sum of reported SAR values is **1.54 W/kg (1g)**. The detail for simultaneous transmission consideration is described in chapter 13.

## **3 Client Information**

## 4 Equipment Under Test (EUT) and Ancillary Equipment (AE)

### 4.1 About EUT

| escription: GSM dual band mobile phone |                              |
|--|------------------------------|
| Model name:                            | Tango Plus US                |
| Marketing name:                        | ALCATEL 2001A                |
| Operating mode(s):                     | GSM 850/1900, BT             |
| Tested Ty Frequency                    | 825 – 848.8 MHz (GSM 850)    |
| Tested Tx Frequency:                   | 1850.2 – 1910 MHz (GSM 1900) |
| GPRS Multislot Class:                  | 12                           |
| GPRS capability Class:                 | В                            |
| Release Version:                       | GSM: Rel5                    |
|  | GPRS: Rel5                   |
| Test device Production information:    | Production unit              |
| Device type:                           | Portable device              |
| Antenna type:                          | Integrated antenna           |
| Accessories/Body-worn configurations:  | Headset                      |
| Form factor:                           | 112mm $\times$ 61.5mm        |

### 4.2 Internal Identification of EUT used during the test

| EUT ID* | IMEI            | HW Version | SW Version |
|---------|-----------------|------------|------------|
| EUT1    | 013765000000482 | Proto      | vA15       |
| EUT2    | 013765000000508 | Proto      | vA15       |

 $^{\ast}\text{EUT}$  ID: is used to identify the test sample in the lab internally.

Note: It is performed to test SAR with the EUT1 and conducted power with the EUT2.

#### 4.3 Internal Identification of AE used during the test

| AE ID* | Description | Model        | SN | Manufacturer |
|--------|-------------|--------------|----|--------------|
| AE1    | Battery     | CAB31L0000C1 | /  | BYD          |
| AE2    | Battery     | CAB31L0000C2 | /  | BAK          |
| AE3    | Headset     | CCB3160A11C1 | /  | Juwei        |
| AE4    | Headset     | CCB3160A11C4 | /  | Meihao       |
| AE5    | Headset     | CCB3160A15C1 | /  | Juwei        |
| AE6    | Headset     | CCB3160A15C4 | /  | Meihao       |

\*AE ID: is used to identify the test sample in the lab internally.

**Note:** AE3 is same as AE5, so they can use the same results. AE4 is same as AE6, so they can use the same results.

## **5 TEST METHODOLOGY**

### **5.1 Applicable Limit Regulations**

**ANSI C95.1–1999:** IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz.

It specifies the maximum exposure limit of **1.6 W/kg** as averaged over any 1 gram of tissue for portable devices being used within 20 cm of the user in the uncontrolled environment.

### 5.2 Applicable Measurement Standards

**IEEE 1528–2003:** Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Body Due to Wireless Communications Devices: Experimental Techniques.

**OET Bulletin 65 (Edition 97-01) and Supplement C(Edition 01-01):** Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits.

**KDB447498 D01: General RF Exposure Guidance v05:** Mobile and Portable Devices RF Exposure Procedures and Equipment Authorization Policies.

**KDB648474 D04 SAR Handsets Multi Xmiter and Ant v01:** SAR Evaluation Considerations for Wireless Handsets.

**KDB865664 D01 SAR measurement 100 MHz to 6 GHz v01:** SAR Measurement Requirements for 100 MHz to 6 GHz

**KDB865664 D02 SAR Reporting v01:** RF Exposure Compliance Reporting and Documentation Considerations

## 6 Specific Absorption Rate (SAR)

#### 6.1 Introduction

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

#### 6.2 SAR Definition

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density  $(\rho)$ . The equation description is as below:

$$SAR = \frac{d}{dt}(\frac{dW}{dm}) = \frac{d}{dt}(\frac{dW}{\rho dv})$$

SAR is expressed in units of Watts per kilogram (W/kg)

SAR measurement can be either related to the temperature elevation in tissue by

$$SAR = c(\frac{\delta T}{\delta t})$$

Where: C is the specific head capacity,  $\delta T$  is the temperature rise and  $\delta t$  is the exposure duration, or related to the electrical field in the tissue by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

Where:  $\sigma$  is the conductivity of the tissue,  $\rho$  is the mass density of tissue and *E* is the RMS electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

## 7 Tissue Simulating Liquids

### 7.1 Targets for tissue simulating liquid

| Table 7.1. Targete for tissue simulating inquia |             |                     |            |                     |            |  |  |  |

Picture 7-4 Liquid depth in the Flat Phantom (1900MHz)

## 8 System verification

#### 8.1 System Setup

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave that comes from a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The equipment setup is shown below:

Picture 8.1 System Setup for System Evaluation

Picture 8.2 Photo of Dipole Setup

### 8.2 System Verification

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device.

The system verification results are required that the area scan estimated 1-g SAR is within 3% of the zoom scan 1-g SAR. The details are presented in annex B.

| Measurement  |           | Target val | ue (W/kg) | Measured | /alue (W/kg) | Devi    | ation   |
|--------------|-----------|------------|-----------|----------|--------------|---------|---------|

#### Table 8.2: System Verification of Body

## **9 Measurement Procedures**

### 9.1 Tests to be performed

In order to determine the highest value of the peak spatial-average SAR of a handset, all device positions, configurations and operational modes shall be tested for each frequency band according to steps 1 to 3 below. A flowchart of the test process is shown in picture 9.1.

Step 1: The tests described in 9.2 shall be performed at the channel that is closest to the centre of

the transmit frequency band ( $f_c$ ) for:

a) all device positions (cheek and tilt, for both left and right sides of the SAM phantom, as described in annex D),

b) all configurations for each device position in a), e.g., antenna extended and retracted, and

c) all operational modes, e.g., analogue and digital, for each device position in a) and configuration in b) in each frequency band.

If more than three frequencies need to be tested according to 11.1 (i.e.,  $N_c$  > 3), then all

frequencies, configurations and modes shall be tested for all of the above test conditions.

**Step 2**: For the condition providing highest peak spatial-average SAR determined in Step 1, perform all tests described in 9.2 at all other test frequencies, i.e., lowest and highest frequencies. In addition, for all other conditions (device position, configuration and operational mode) where the peak spatial-average SAR value determined in Step 1 is within 3 dB of the applicable SAR limit, it is recommended that all other test frequencies shall be tested as well.

**Step 3**: Examine all data to determine the highest value of the peak spatial-average SAR found in Steps 1 to 2.

Picture 9.1 Block diagram of the tests to be performed

### 9.2 General Measurement Procedure

The area and zoom scan resolutions specified in the table below must be applied to the SAR measurements and fully documented in SAR reports to qualify for TCB approval. Probe boundary effect error compensation is required for measurements with the probe tip closer than half a probe tip diameter to the phantom surface. Both the probe tip diameter and sensor offset distance must satisfy measurement protocols; to ensure probe boundary effect errors are minimized and the higher fields closest to the phantom surface can be correctly measured and extrapolated to the phantom surface for computing 1-g SAR. Tolerances of the post-processing algorithms must be verified by the test laboratory for the scan resolutions used in the SAR measurements, according to the reference distribution functions specified in IEEE Std 1528-2003. The results should be documented as part of the system validation records and may be requested to support test results when all the measurement parameters in the following table are not satisfied.

|   |  |  | $\leq$ 3 GHz   | > 3 GHz  |  |
|---|--|--|--|--|--|
| Maximum distance from closest measurement point<br>(geometric center of probe sensors) to phantom surface |  |  | $5\pm1$ mm   | ½·δ·ln(2) ± 0.5 mm   |  |
| Maximum probe angle f<br>normal at the measurem   |  |  | 30°±1°   | 20°±1°   |  |
|   |  |  | $\leq 2 \text{ GHz:} \leq 15 \text{ mm}$ $2 - 3 \text{ GHz:} \leq 12 \text{ mm}$   | $3 - 4 \text{ GHz} \le 12 \text{ mm}$<br>$4 - 6 \text{ GHz} \le 10 \text{ mm}$   |  |
| Maximum area scan spatial resolution: $\Delta x_{Area}$ , $\Delta y_{Area}$                               |  |  | When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be $\leq$ the corresponding x or y dimension of the test device with at least one measurement point on the test device. |  |  |
| Maximum zoom scan spatial resolution: $\Delta x_{Zoom}$ , $\Delta y_{Zoom}$                               |  |  | $\leq 2 \text{ GHz} \leq 8 \text{ mm}$<br>2 - 3 GHz: $\leq 5 \text{ mm}^*$   | $3 - 4 \text{ GHz:} \le 5 \text{ mm}^4$<br>$4 - 6 \text{ GHz:} \le 4 \text{ mm}^4$   |  |
|   | uniform grid: $\Delta z_{Zoom}(n)$                             |  | ≤ 5 mm   | $3 - 4 \text{ GHz} \le 4 \text{ mm}$<br>$4 - 5 \text{ GHz} \le 3 \text{ mm}$<br>$5 - 6 \text{ GHz} \le 2 \text{ mm}$                   |  |
| Maximum zoom scan<br>spatial resolution,<br>normal to phantom<br>surface                                  | graded   | $\Delta z_{Zoom}(1)$ : between 1 <sup>st</sup><br>two points closest to<br>phantom surface | ≤ 4 mm   | 3 – 4 GHz: ≤ 3 mm<br>4 – 5 GHz: ≤ 2.5 mm<br>5 – 6 GHz: ≤ 2 mm  |  |

| Minimum zoom scan<br>volume   | X V Z  |  | ≥ 30 mm  | $3 - 4 \text{ GHz}$ : $\geq 28 \text{ mm}$<br>$4 - 5 \text{ GHz}$ : $\geq 25 \text{ mm}$<br>$5 - 6 \text{ GHz}$ : $\geq 22 \text{ mm}$ |  |
| 2011 for details.   | -  | -  | idence to the tissue medium; see   |  |  |

When zoom scan is required and the <u>reported</u> SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

#### 9.3 Power Drift

To control the output power stability during the SAR test, DASY4 system calculates the power drift by measuring the E-field at the same location at the beginning and at the end of the measurement for each test position. These drift values can be found in Table 14.2 to Table 14.15 labeled as: (Power Drift [dB]). This ensures that the power drift during one measurement is within 5%.

## 10 Area Scan Based 1-g SAR

### 10.1 Requirement of KDB

According to the KDB447498 D01 v05, when the implementation is based the specific polynomial fit algorithm as presented at the 29th Bioelectromagnetics Society meeting (2007) and the estimated 1-g SAR is  $\leq$  1.2 W/kg, a zoom scan measurement is not required provided it is also not needed for any other purpose; for example, if the peak SAR location required for simultaneous transmission SAR test exclusion can be determined accurately by the SAR system or manually to discriminate between distinctive peaks and scattered noisy SAR distributions from area scans.

There must not be any warning or alert messages due to various measurement concerns identified by the SAR system; for example, noise in measurements, peaks too close to scan boundary, peaks are too sharp, spatial resolution and uncertainty issues etc. The SAR system verification must also demonstrate that the area scan estimated 1-g SAR is within 3% of the zoom scan 1-g SAR (See Annex B). When all the SAR results for each exposure condition in a frequency band and wireless mode are based on estimated 1-g SAR, the 1-g SAR for the highest SAR configuration must be determined by a zoom scan.

### **10.2 Fast SAR Algorithms**

The approach is based on the area scan measurement applying a frequency dependent attenuation parameter. This attenuation parameter was empirically determined by analyzing a large number of phones. The MOTOROLA FAST SAR was developed and validated by the MOTOROLA Research Group in Ft. Lauderdale.

In the initial study, an approximation algorithm based on Linear fit was developed. The accuracy of the algorithm has been demonstrated across a broad frequency range (136-2450 MHz) and for both 1- and 10-g averaged SAR using a sample of 264 SAR measurements from 55 wireless handsets. For the sample size studied, the root-mean-squared errors of the algorithm are 1.2% and 5.8% for 1- and 10-g averaged SAR, respectively. The paper describing the algorithm in detail is expected to be published in August 2004 within the Special Issue of Transactions on MTT.

In the second step, the same research group optimized the fitting algorithm to an Polynomial fit whereby the frequency validity was extended to cover the range 30-6000MHz. Details of this study can be found in the BEMS 2007 Proceedings.

Both algorithms are implemented in DASY software.

## **11 Conducted Output Power**

## **11.1 Manufacturing tolerance**

#### 11.2 GSM Measurement result

During the process of testing, the EUT was controlled via Agilent Digital Radio Communication tester (E5515C) to ensure the maximum power transmission and proper modulation. This result contains conducted output power for the EUT. In all cases, the measured peak output power should be greater and within 5% than EMI measurement.

NOTES:

1) Division Factors

To average the power, the division factor is as follows:

1TX-slot = 1 transmit time slot out of 8 time slots=> conducted power divided by (8/1) => -9.03dB

2TX-slots = 2 transmit time slots out of 8 time slots=> conducted power divided by (8/2) => -6.02dB

3TX-slots = 3 transmit time slots out of 8 time slots=> conducted power divided by (8/3) => -4.26dB

4TX-slots = 4 transmit time slots out of 8 time slots=> conducted power divided by (8/4) => -3.01dB

According to the conducted power as above, the body measurements are performed with 1Txslots for GPRS.

#### **11.3 BT Measurement result**

The output power of BT antenna is as following:

| Mode          | Conducted Power (dBm) |                      |                      |  |  |
|---------------|-----------------------|----------------------|----------------------|--|--|
| wode          | Channel 0 (2402MHz)   | Channel 39 (2441MHz) | Channel 78 (2480MHz) |  |  |

| EDR3M-8DPSK   | 10.15                 | 10.40                | 10.19                |  |  |

## **12 Simultaneous TX SAR Considerations**

### **12.1 Introduction**

The following procedures adopted from "FCC SAR Considerations for Cell Phones with Multiple Transmitters" are applicable to handsets with built-in unlicensed transmitters such as 802.11 a/b/g and Bluetooth devices which may simultaneously transmit with the licensed transmitter. For this device, the BT can transmit simultaneous with other transmitters.

### **12.2 Transmit Antenna Separation Distances**

Picture 12.1 Antenna Locations

### **12.3 SAR Measurement Positions**

According to the KDB941225 D06 Hot Spot SAR v01, the edges with less than 2.5 cm distance to the antennas need to be tested for SAR.

|             | SAR measurement positions |      |           |            |          |             |  |  |  |  |  |
|-------------|---------------------------|------|-----------|------------|----------|-------------|--|--|--|--|--|
| Mode        | Front                     | Rear | Left edge | Right edge | Top edge | Bottom edge |  |  |  |  |  |
| GSM850/1900 | Yes                       | Yes  | Yes       | Yes        | No       | Yes         |  |  |  |  |  |

### 12.4 Standalone SAR Test Exclusion Considerations

Standalone 1-g head or body SAR evaluation by measurement or numerical simulation is not required when the corresponding SAR Exclusion Threshold condition, listed below, is satisfied. The 1-g SAR test exclusion threshold for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)]  $\cdot$  [ $\sqrt{f}(GHz)$ ]  $\leq$  3.0 for 1-g SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison

According to the KDB447498 appendix A, the SAR test exclusion threshold for 2450MHz at 10mm test separation distances is 19mW.

#### Appendix A

#### SAR Test Exclusion Thresholds for 100 MHz – 6 GHz and $\leq$ 50 mm

Approximate SAR Test Exclusion Power Thresholds at Selected Frequencies and Test Separation Distances are illustrated in the following Table.

| MHz  | 5  | 10 | 15  | 20  | 25  | mm                    |
|------|----|----|-----|-----|-----|-----------------------|
| 150  | 39 | 77 | 116 | 155 | 194 |                       |
| 300  | 27 | 55 | 82  | 110 | 137 |                       |
| 450  | 22 | 45 | 67  | 89  | 112 |                       |
| 835  | 16 | 33 | 49  | 66  | 82  |                       |
| 900  | 16 | 32 | 47  | 63  | 79  |                       |
| 1500 | 12 | 24 | 37  | 49  | 61  | SAR Test<br>Exclusion |
| 1900 | 11 | 22 | 33  | 44  | 54  | Threshold (mW)        |
| 2450 | 10 | 19 | 29  | 38  | 48  |                       |
| 3600 | 8  | 16 | 24  | 32  | 40  |                       |
| 5200 | 7  | 13 | 20  | 26  | 33  |                       |
| 5400 | 6  | 13 | 19  | 26  | 32  |                       |
| 5800 | 6  | 12 | 19  | 25  | 31  |                       |

#### Picture 12.2 Power Thresholds

| Band/Mode | F(GHz) |                | RF outp | SAR test |           |
|-----------|--------|----------------|---------|----------|-----------|
| Band/Mode | F(GHZ) | threshold (mW) | dBm     | mW       | exclusion |
| Bluetooth | 2.441  | 19             | 10.40   | 10.96    | Yes       |

## **13 Evaluation of Simultaneous**

#### Table 13.1: The sum of reported SAR values for GSM and Bluetooth

|  | Position                | GSM  | BT*  | Sum  |
|--|-------------------------|------|------|------|
| Highest reported<br>SAR value for Head | Right hand, Touch cheek | 0.74 | 0.26 | 1.00 |
| Highest reported<br>SAR value for Body | Rear                    | 1.28 | 0.26 | 1.54 |

BT\* - Estimated SAR for Bluetooth (see the table 13.2)

| Table 13.2: Estimated \$ | SAR for Bluetooth |
|--------------------------|-------------------|
|--------------------------|-------------------|

| Mode/Pand | F (GHz) | Distance (mm) | Upper limi | Estimated <sub>1g</sub> |        |
|-----------|---------|---------------|------------|-------------------------|--------|
| Mode/Band | г (Сп2) | Distance (mm) | dBm        | mW                      | (W/kg) |
| Bluetooth | 2.441   | 10            | 11         | 12.59                   | 0.26   |

\* - Maximum possible output power declared by manufacturer

When standalone SAR test exclusion applies to an antenna that transmits simultaneously with other antennas, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance,

mm)]·[ $\sqrt{f(GHz)/x}$ ] W/kg for test separation distances  $\leq$  50 mm;

where x = 7.5 for 1-g SAR.

When the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion

#### Conclusion:

According to the above tables, the sum of reported SAR values is < 1.6W/kg. So the simultaneous transmission SAR with volume scans is not required.

## 14 SAR Test Result

It is determined by user manual for the distance between the EUT and the phantom bottom. The distance is 10mm and just applied to the condition of body worn accessory.

It is performed for all SAR measurements with area scan based 1-g SAR estimation (Fast SAR). A zoom scan measurement is added when the estimated 1-g SAR is the highest measured SAR in each exposure configuration, wireless mode and frequency band combination or more than 1.2W/kg.

The calculated SAR is obtained by the following formula:

Reported SAR = Measured SAR  $\times 10^{(P_{Target} - P_{Measured})/10}$ 

Table 14 1. Duty Cycle

Where P<sub>Target</sub> is the power of manufacturing upper limit;

P<sub>Measured</sub> is the measured power in chapter 11.

|                        | 14.1: Duty Cycle |
|------------------------|------------------|
| Mode                   | Duty Cycle       |
| Speech for GSM850/1900 | 1:8.3            |
| GPRS for GSM850/1900   | 1:8.3            |

#### 14.1 The evaluation of multi-batteries

We'll perform the head measurement in all bands with the primary battery depending on the evaluation of multi-batteries and retest on highest value point with other batteries. Then, repeat the measurement in the Body test.

| Frequency |     | Side  | Test     | Potton (Type | SAR(1g) | Power     |  |
|-----------|-----|-------|----------|--------------|---------|-----------|--|
| MHz       | Ch. | Side  | Position | Battery Type | (W/kg)  | Drift(dB) |  |
| 1880      | 661 | Right | Touch    | CAB31L0000C1 | 0.668   | 0.04      |  |
| 1880      | 661 | Right | Touch    | CAB31L0000C2 | 0.658   | 0.02      |  |

Table 14.2: The evaluation of multi-batteries for Head Test

Note: According to the values in the above table, the battery, CAB31L0000C1, is the primary battery. We'll perform the head measurement with this battery and retest on highest value point with others.

| Frequency |     | Mada | Test          | Spacing | Potton / Tupo | SAR(1g) | Power     |
|-----------|-----|------|---------------|---------|---------------|---------|-----------|
| MHz       | Ch. | Mode | Position (mm) |         | Battery Type  | (W/kg)  | Drift(dB) |
| 1850.2    | 512 | GPRS | Rear          | 10      | CAB31L0000C1  | 1.16    | 0.00      |
| 1850.2    | 512 | GPRS | Rear          | 10      | CAB31L0000C2  | 1.14    | 0.04      |

Table 14.3: The evaluation of multi-batteries for Body Test

Note: According to the values in the above table, the battery, CAB31L0000C1, is the primary battery. We'll perform the Body measurement with this battery and retest on highest value point with others.

### 14.2 SAR results for Fast SAR

Note1: The distance between the EUT and the phantom bottom is 10mm.

## **15 SAR Measurement Variability**

SAR measurement variability must be assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements. When both head and body tissue-equivalent media are required for SAR measurements in a frequency band, the variability measurement procedures should be applied to the tissue medium with the highest measured SAR, using the highest measured SAR configuration for that tissue-equivalent medium.

The following procedures are applied to determine if repeated measurements are required. 1) Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg; steps 2) through 4) do not apply.

2) When the original highest measured SAR is  $\geq$  0.80 W/kg, repeat that measurement once.

3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is  $\geq$  1.45 W/kg (~ 10% from the 1-g SAR limit).

4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq$  1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20.

| Freque | ency | Test     | Spacing | Original      | First                  | The   | Second                 |

#### Table B.1 Comparison between area scan and zoom scan for system verification

# ANNEX C SAR Measurement Setup

### C.1 Measurement Set-up

The Dasy4 or DASY5 system for performing compliance tests is illustrated above graphically. This system consists of the following items:

Picture C.1 SAR Lab Test Measurement Set-up

- A standard high precision 6-axis robot (Stäubli TX=RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running WinXP and the DASY4 or DASY5 software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as
- warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

#### C.2 Dasy4 or DASY5 E-field Probe System

The SAR measurements were conducted with the dosimetric probe designed in the classical triangular configuration and optimized for dosimetric evaluation. The probe is constructed using the thick film technique; with printed resistive lines on ceramic substrates. The probe is equipped with an optical multifiber line ending at the front of the probe tip. It is connected to the EOC box on the robot arm and provides an automatic detection of the phantom surface. Half of the fibers are connected to a pulsed infrared transmitter, the other half to a synchronized receiver. As the probe approaches the surface, the reflection from the surface produces a coupling from the transmitting to the receiving fibers. This reflection increases first during the approach, reaches maximum and then decreases. If the probe is flatly touching the surface, the coupling is zero. The distance of the coupling maximum to the surface is independent of the surface reflectivity and largely independent of the surface to probe angle. The DASY4 or DASY5 software reads the reflection durning a software approach and looks for the maximum using 2<sup>nd</sup> ord curve fitting. The approach is stopped at reaching the maximum.

#### **Probe Specifications:**

| · · · · · · · · · · · · · · · · · · · |                                       |

Picture C.2 Near-field Probe

**Picture C.3 E-field Probe** 

### C.3 E-field Probe Calibration

Each E-Probe/Probe Amplifier combination has unique calibration parameters. A TEM cell calibration procedure is conducted to determine the proper amplifier settings to enter in the probe parameters. The amplifier settings are determined for a given frequency by subjecting the probe to a known E-field density (1 mW/cm<sup>2</sup>) using an RF Signal generator, TEM cell, and RF Power Meter.

The free space E-field from amplified probe outputs is determined in a test chamber. This calibration can be performed in a TEM cell if the frequency is below 1 GHz and inn a waveguide or other methodologies above 1 GHz for free space. For the free space calibration, the probe is placed

in the volumetric center of the cavity and at the proper orientation with the field. The probe is then rotated 360 degrees until the three channels show the maximum reading. The power density readings equates to  $1 \text{ mW/ cm}^2$ .

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulated brain tissue. The E-field in the medium correlates with the temperature rise in the dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

$$SAR = C \frac{\Delta T}{\Delta t}$$

Where:

 $\Delta t$  = Exposure time (30 seconds), C = Heat capacity of tissue (brain or muscle),  $\Delta T$  = Temperature increase due to RF exposure.

$$SAR = \frac{\left|E\right|^2 \cdot \sigma}{\rho}$$

Where:  $\sigma$  = Simulated tissue conductivity,  $\rho$  = Tissue density (kg/m<sup>3</sup>).

## C.4 Other Test Equipment

### C.4.1 Data Acquisition Electronics(DAE)

The data acquisition electronics consist of a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16 bit AD-converter and a command decoder with a control logic unit. Transmission to the measurement server is accomplished through an optical downlink for data and status information, as well as an optical uplink for commands and the clock.

The mechanical probe mounting device includes two different sensor systems for frontal and sideways probe contacts. They are used for mechanical surface detection and probe collision detection.

The input impedance of the DAE is 200 MOhm; the inputs are symmetrical and floating. Common mode rejection is above 80 dB.

PictureC.4: DAE

### C.4.2 Robot

The SPEAG DASY system uses the high precision robots (DASY4: RX90XL; DASY5: RX160L) type from Stäubli SA (France). For the 6-axis controller system, the robot controller version from Stäubli is used. The Stäubli robot series have many features that are important for our application:

- High precision (repeatability 0.02mm)
- High reliability (industrial design)
- > Low maintenance costs (virtually maintenance free due to direct drive gears; no belt drives)
- Jerk-free straight movements (brushless synchron motors; no stepper motors)
- > Low ELF interference (motor control fields shielded via the closed metallic construction shields)

Picture C.5 DASY 4

Picture C.6 DASY 5

### C.4.3 Measurement Server

The Measurement server is based on a PC/104 CPU broad with CPU (dasy4: 166 MHz, Intel Pentium; DASY5: 400 MHz, Intel Celeron), chipdisk (DASY4: 32 MB; DASY5: 128MB), RAM (DASY4: 64 MB, DASY5: 128MB). The necessary circuits for communication with the DAE electronic box, as well as the 16 bit AD converter system for optical detection and digital I/O interface are contained on the DASY I/O broad, which is directly connected to the PC/104 bus of the CPU broad.

The measurement server performs all real-time data evaluation of field measurements and surface detection, controls robot movements and handles safety operation. The PC operating system cannot interfere with these time critical processes. All connections are supervised by a watchdog, and disconnection of any of the cables to the measurement server will automatically disarm the robot and disable all program-controlled robot movements. Furthermore, the measurement server is equipped with an expansion port which is reserved for future applications. Please note that this expansion port does not have a standardized pinout, and therefore only devices provided by SPEAG can be connected. Devices from any other supplier could seriously damage the measurement server.

Picture C.7 Server for DASY 4

#### Picture C.8 Server for DASY 5

#### C.4.4 Device Holder for Phantom

The SAR in the phantom is approximately inversely proportional to the square of the distance between the source and the liquid surface. For a source at 5mm distance, a positioning uncertainty of  $\pm 0.5$ mm would produce a SAR uncertainty of  $\pm 20\%$ . Accurate device positioning is therefore crucial for accurate and repeatable measurements. The positions in which the devices must be measured are defined by the standards.

The DASY device holder is designed to cope with the different positions given in the standard. It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points). The rotation centers for both scales is the ear reference point (ERP). Thus the device needs no repositioning when changing the angles.

The DASY device holder is constructed of low-loss

POM material having the following dielectric

parameters: relative permittivity  $\varepsilon$  =3 and loss tangent  $\delta$  =0.02. The amount of dielectric material has been reduced in the closest vicinity of the device, since measurements have suggested that the influence of the clamp on the test results could thus be lowered.

<Laptop Extension Kit>

The extension is lightweight and made of POM, acrylic glass and foam. It fits easily on the upper part of the Mounting Device in place of the phone positioner. The extension is fully compatible with the Twin-SAM and ELI phantoms.

**Picture C.9-1: Device Holder** 

Picture C.9-2: Laptop Extension Kit

#### C.4.5 Phantom

The SAM Twin Phantom V4.0 is constructed of a fiberglass shell integrated in a table. The shape of the shell is based on data from an anatomical study designed to

Represent the 90<sup>th</sup> percentile of the population. The phantom enables the dissymmetric evaluation

### No. 2013SAR00098 Page 54 of 88

of SAR for both left and right handed handset usage, as well as body-worn usage using the flat phantom region. Reference markings on the Phantom allow the complete setup of all predefined phantom positions and measurement grids by manually teaching three points in the robot. The shell phantom has a 2mm shell thickness (except the ear region where shell thickness increases to 6 mm).

Shell Thickness:2 ± 0. 2 mmFilling Volume:Approx. 25 litersDimensions:810 x 1000 x 500 mm (H x L x W)Available:Special

Picture C.10: SAM Twin Phantom

# ANNEX D Position of the wireless device in relation to the phantom

### **D.1 General considerations**

This standard specifies two handset test positions against the head phantom – the "cheek" position and the "tilt" position.

Picture D.1-a Typical "fixed" case handset Picture D.1-b Typical "clam-shell" case handset

Picture D.2 Cheek position of the wireless device on the left side of SAM

Picture D.3 Tilt position of the wireless device on the left side of SAM

#### D.2 Body-worn device

A typical example of a body-worn device is a mobile phone, wireless enabled PDA or other battery operated wireless device with the ability to transmit while mounted on a person's body using a carry accessory approved by the wireless device manufacturer.

Picture D.4 Test positions for body-worn devices

#### D.3 Desktop device

A typical example of a desktop device is a wireless enabled desktop computer placed on a table or desk when used.

The DUT shall be positioned at the distance and in the orientation to the phantom that corresponds to the intended use as specified by the manufacturer in the user instructions. For devices that employ an external antenna with variable positions, tests shall be performed for all antenna positions specified. Picture 8.5 show positions for desktop device SAR tests. If the intended use is not specified, the device shall be tested directly against the flat phantom.

# ANNEX E Equivalent Media Recipes

The liquid used for the frequency range of 800-3000 MHz consisted of water, sugar, salt, preventol, glycol monobutyl and Cellulose. The liquid has been previously proven to be suited for worst-case. The Table E.1 shows the detail solution. It's satisfying the latest tissue dielectric parameters requirements proposed by the IEEE 1528 and IEC 62209.

#### Table E.1: Composition of the Tissue Equivalent Matter

# ANNEX F System Validation

The SAR system must be validated against its performance specifications before it is deployed. When SAR probes, system components or software are changed, upgraded or recalibrated, these must be validated with the SAR system(s) that operates with such components.

|           |              | Table F.1: System | Validation      |                    |
|-----------|--------------|-------------------|-----------------|--------------------|
| Probe SN. | Liquid name  | Validation date   | Frequency point | Status (OK or Not) |
