Equipment : RFID

Brand Name : Elo Touch Solutions

Model No. : KIT,NFC,USB,ESY X Series/AAiO/02 Series

FCC ID : RBWELO-RFID

Standard : 47 CFR FCC Part 15.225

Operating Band : 13.553 – 13.567 MHz (channel freq. 13.56 MHz)

Equipment Class: DXX

Applicant : Elo Touch Solutions, Inc

Manufacturer 1033 McCarthy Blvd. Milpitas, CA

95035, USA.

The product sample received on Nov. 10, 2012 and completely tested on Mar. 07, 2015. We, SPORTON, would like to declare that the tested sample has been evaluated in accordance with the procedures given in ANSI C63.10-2009 and shown compliance with the applicable technical standards.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC., the test report shall not be reproduced except in full.

\boxtimes	Ref	er as ANSI C63.10, clause 6.2 for AC power-line conducted emissions.						
\boxtimes	If AC	C conducted emissions fall in operating band, then following below test method confirm final result.						
		Accept measurements done with a suitable dummy load replacing the antenna under the following conditions: (1) Perform the AC line conducted tests with the antenna connected to determine compliance with FCC 15.207 limits outside the transmitter's fundamental emission band; (2) Retest with a dummy load to determine compliance with FCC 15.207 limits within the transmitter's fundamental emission band.						
		For a device with a permanent antenna operating at or below 30 MHz, accept measurements done with a suitable dummy load, in lieu of the permanent antenna under the following conditions: (1) Perform the AC line conducted tests with the permanent antenna to determine compliance with the FCC 15.207 limits outside the transmitter's fundamental emission band; (2) Retest with a dummy load in lieu of the permanent antenna to determine compliance with the FCC 15.207 limits within the transmitter's fundamental emission band.

3.3.3 Test Procedures

Test Method						
Refer as ANSI C63.10, clause 6.4 for radiated emissions from below 30 MHz. quasi peak measurement of the fundamental.						
At frequencies below 30 MHz, measurements may be performed at a distance closer than that specified in the requirements; however, an attempt should be made to avoid making measurements in the near field. Pending the development of an appropriate measurement procedure for measurements performed below 30 MHz, when performing measurements at a closer distance than specified, the results shall be following below methods.						
The results shall be extrapolated to the specified distance by making measurements at a minimum of two distances on at least one radial to determine the proper extrapolation factor.						
The results shall be by using the square of an inverse linear distance extrapolation factor (40 dB/decade).						
For radiated measurement. Loop antenna was rotated about the horizontal and vertical axis and the equipment to be measured and the test antenna shall be oriented to obtain the maximum emitted field strength level.

Note 1: Test distance for frequencies at or above 30 MHz, measurements may be performed at a distance other than the limit distance provided they are not performed in the near field and the emissions to be measured can be detected by the measurement equipment. When performing measurements at a distance other than that specified, the results shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade (inverse of linear distance for field-strength measurements, inverse of linear distance-squared for power-density measurements).

Note 2: Test distance for frequencies at below 30 MHz, measurements may be performed at a distance closer than the EUT limit distance; however, an attempt should be made to avoid making measurements in the near field. When performing measurements below 30 MHz at a closer distance than the limit distance, the results shall be extrapolated to the specified distance by either making measurements at a minimum of two or more distances on at least one radial to determine the proper extrapolation factor or by using the square of an inverse linear distance extrapolation factor (40 dB/decade). The test report shall specify the extrapolation method used to determine compliance of the EUT.

Report No.: FR2N0203-01

3.4.4 Test Setup

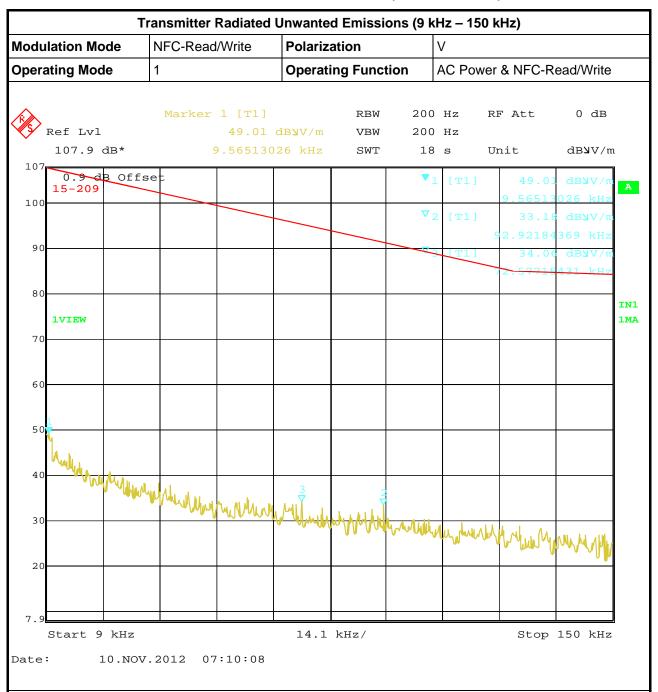

Magnetic field tests shall be performed in the frequency range of 9 kHz to 30 MHz using a calibrated loop antenna. The center of the loop shall be 1 m above the ground. Electric field tests shall be performed in the frequency range of 30 MHz to 1000 MHz using a calibrated bi-log antenna. the antenna height shall be varied from 1 m to 4 m.

3.5 Frequency Stability

3.5.1 Frequency Stability Limit

Frequency Stability Limit

☐ Carrier frequency stability shall be maintained to ±0.01% (±100 ppm).

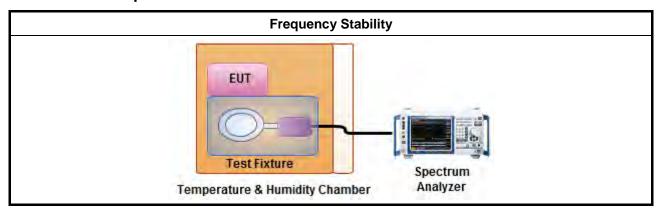

3.5.2 Measuring Instruments

Refer a test equipment and calibration data table in this test report.

3.5.3 Test Procedures

	Test Method									
\boxtimes	Refer as ANSI C63.10, clause 6.8 for frequency stability tests									
	□ Frequency stability with respect to ambient temperature									
	□ Frequency stability when varying supply voltage									
	For conducted measurement.
