#### 0 Summary

#### 0.1 Technical Report Summary

#### Type of Authorization

Certification for an Intentional Radiator (Frequency Hopping Spread Spectrum).

#### **Applicable FCC Rules**

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 (10-1-09 Edition) and 15 (10-1-09 Edition). The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification

Part 15, Subpart C – Intentional Radiators

§ 15.201 Equipment authorization requirement

§ 15.207 Conducted limits

§ 15.209 Radiated emission limits; general requirements

§ 15.247 Operation within the bands 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz

#### Note:

The tests were selected and performed with reference to the FCC Public Notice DA 00-705, released March 30, 2000.

Instead of applying ANSI C63.4-1992 which is referenced in the FCC Public Note, the newer ANSI C63.4-2003 is applied.

#### **Summary Test Results:**

The EUT complied with all performed tests as listed in chapter 0.2 Measurement Summary.

### 2 Test object Data

#### 2.1 General EUT Description

**Equipment under Test** Bluetooth transceiver

**Type Designation:** Parrot RnB4c

Kind of Device: Car Radio with Bluetooth

(optional)

Voltage Type: DC (car)
Voltage level: 12V

**Modulation Type:** GFSK, 8DPSK,  $\pi/4$  DQPSK

#### General product description:

Bluetooth is a short-range radio link intended to be a cable replacement between portable and/or fixed electronic devices.

Bluetooth operates in the unlicensed ISM Band at 2.4 GHz. In the US a band of 83.5 MHz width is available. In this band, the Bluetooth technology defines 79 RF channels spaced 1 MHz (2402 - 2480 MHz). The actual RF channel is chosen from a pseudo-random hopping sequence through the 79 channels. A channel is occupied for a defined amount of time slots, with a nominal slot length of 625 µs. The maximum time slot length on one channel is defined by the packet type and is 0.625 ms for DH1 packets, 1.875 ms for DH3 and 3.125 ms for DH5. The nominal hop rate is 1600 hops/s for DH1, 1600/3 for DH3 and 1600/5 for DH5. All frequencies are equally used. The maximum nominal average time of occupancy is 0.4 s within a period of 79\*0.4 seconds.

The basic data rate of 1 Mbps uses GFSK modulation and the enhanced data rate uses PSK modulation. For the enhanced data rate of 3 Mbps 8DPSK modulation and of 2 Mbps  $\pi/4$  DQPSK modulation is used.

#### The EUT provides the following ports:

#### **Ports**

Temp antenna connector Enclosure System connectors

The main components of the EUT are listed and described in Chapter 2.2.

#### 2.2 EUT Main components

NOTE: The short description is used to simplify the identification of the EUT in this test report.

#### 2.3 Ancillary Equipment

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

| Short       | Equipment  | Type        | Serial no. | <b>HW Status</b> | SW Status | FCC ID |
|-------------|------------|-------------|------------|------------------|-----------|--------|
| Description | under Test | Designation |            |                  |           |        |
|             |            |             |            |                  |           |        |

#### 2.4 Auxiliary Equipment

For the purposes of this test report, auxiliary equipment is defined as equipment which is used temporarily to enable operational and control features especially used for the tests of the EUT which is not used during normal operation or equipment that is used during the tests in combination with the EUT but is not subject of this test report. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Auxiliary Equipment can influence the test results.

| Short       | Equipment  | Type        | Serial no. | HW Status | SW Status | FCC ID   |
|-------------|------------|-------------|------------|-----------|-----------|----------|
| Description | under Test | Designation |            |           |           |          |
|             |            |             |            |           |           | <u>.</u> |

#### 2.5 EUT Setups

This chapter describes the combination of EUTs and ancillary equipment used for testing.

| Setup No. | Combination of EUTs | Description                      |
|-----------|---------------------|----------------------------------|
| Setup_a01 | EUT A               | setup for radiated measurements  |
| Setup_b01 | EUT B               | setup for conducted measurements |
| Setup_a02 | EUT C               | setup for radiated measurements  |

#### 2.6 Operating Modes

This chapter describes the operating modes of the EUTs used for testing.

| Op. Mode   | <b>Description of Operating Modes</b> | Remarks                                   |
|------------|---------------------------------------|---|
| op-mode 1  | The EUT transmits on 2402 MHz         | Loopback mode, basic data rate 1 Mbps     |
| op-mode 2  | The EUT transmits on 2441 MHz         | Loopback mode, basic data rate 1 Mbps     |
| op-mode 3  | The EUT transmits on 2480 MHz         | Loopback mode, basic data rate 1 Mbps     |
| op-mode 4  | The EUT is in Hopping mode            | The EUT is hopping on 79 channels,        |
|            |                                       | basic data rate 1 Mbps                    |

#### 2.7.1 FCC ID label

Please refer to the documentation of the applicant.

#### 2.7.2 Location of the label on the EUT

Please refer to the documentation of the applicant.

#### 3 Test Results

#### 3.1 Occupied bandwidth

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.31

#### 3.1.1 Test Description

The Equipment Under Test (EUT) was setup to perform the occupied bandwidth measurements.

The reference level is the level of the highest amplitude signal observed from the transmitter at either the fundamental frequency or first-order modulation products in all typical modes of operation, including the unmodulated carrier, even if atypical. The results recorded were measured with the modulation which produces the worst-case (widest) occupied bandwidth. The resolution bandwidth for measuring the reference level and the occupied bandwidth was 30 kHz.

The EUT was connected to the spectrum analyzer via a short coax cable.

#### 3.1.2 Test Requirements / Limits

FCC Part 15, Subpart C, §15.247 (a) (1)

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

#### Implication by the test laboratory:

Since the Bluetooth technology defines a fixed channel separation of 1 MHz this design parameter defines the maximum allowed occupied bandwidth depending on the EUT's output power:

- 1. Under the provision that the system operates with an output power not greater than 125 mW (21.0 dBm):
  - Implicit Limit: Max. 20 dB BW = 1.0 MHz / 2/3 = 1.5 MHz
- 2. If the system output power exceeds 125 mW (21.0 dBm): Implicit Limit: Max. 20 dB BW = 1.0 MHz

Used conversion factor: Output power (dBm) = 10 log (Output power (W) / 1mW)

The measured output power of the system is below 125 mW (21.0 dBm). For the results, please refer to the related chapter of this report. Therefore the limit is determined as 1.5 MHz.

#### 3.2 Peak power output

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.31

#### 3.2.1 Test Description

The Equipment Under Test (EUT) was set up to perform the output power measurements. The resolution bandwidth for measuring the output power was set to 3 MHz. The reference level of the spectrum analyzer was set higher than the output power of the EUT. The EUT was connected to the spectrum analyzer via a short coax cable with a known loss.

#### 3.2.2 Test Requirements / Limits

FCC Part 15, Subpart C, §15.247 (b) (1)

- (b) The maximum peak conducted output power of the intentional radiator shall not exceed the following:
- (1) For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt.

Used conversion factor: Limit (dBm) = 10 log (Limit (W)/1mW)

==> Maximum Output Power: 30 dBm

#### 3.3 Spurious RF conducted emissions

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.31

#### 3.3.1 Test Description

The Equipment Under Test (EUT) was set up to perform the spurious emissions measurements.

The EUT was connected to spectrum analyzer via a short coax cable with a known loss. Analyzer settings:

- Detector: Peak-Maxhold

Frequency range: 30 – 25000 MHz
Resolution Bandwidth (RBW): 100 kHz
Video Bandwidth (VBW): 300 kHz

- Sweep Time: 330 s

The reference value for the measurement of the spurious RF conducted emissions is determined during the test "band edge compliance" (cf. chapter 3.5). This value is used to calculate the 20 dBc limit.

#### 3.3.2 Test Requirements / Limits

FCC Part 15, Subpart C, §15.247 (c)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

#### 3.4 Spurious radiated emissions

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: ANSI C 63.4, 2003

#### 3.4.1 Test Description

The test set-up was made in accordance to the general provisions of ANSI C 63.4-2003. The Equipment Under Test (EUT) was set up on a non-conductive table  $1.0 \times 2.0$  m in the semi-anechoic chamber. The test was performed at the distance of 3 m between the EUT and the receiving antenna.

The radiated emissions measurements were made in a typical installation configuration. The measurement procedure is implemented into the EMI test software ES-K1 from R&S.

#### 1. Measurement up to 30 MHz

The test set-up was made in accordance to the general provisions of ANSI C 63.4-2003. The Equipment Under Test (EUT) was set up on a non-conductive table in the anechoic chamber.

The radiated emissions measurements were made in a typical installation configuration. The measurement procedure is implemented into the EMI test software ES-K1 from R&S. The Loop antenna HFH2-Z2 is used.

Step 1: pre-measurement

- Anechoic chamber
- Antenna distance: 10 m
- Detector: Peak-Maxhold
- Frequency range: 0.009 0.15 and 0.15 30 MHz
- Frequency steps: 0.1 kHz and 5 kHz
- IF-Bandwidth: 0.2 kHz and 10 kHz
- Measuring time / Frequency step: 100 ms

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

#### Step 2: final measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is to find the maximum emission level.

- Open area test side
- Antenna distance: according to the Standard
- Detector: Quasi-Peak
- Frequency range: 0.009 30 MHz
- Frequency steps: measurement at frequencies detected in step 1
- IF-Bandwidth: 200 Hz 10 kHz
- Measuring time / Frequency step: 100 ms

#### 2. Measurement above 30 MHz and up to 1 GHz

Step 1: Preliminary scan

Preliminary test to identify the highest amplitudes relative to the limit.

Settings for step 1:

- Detector: Peak-Maxhold
- Frequency range: 30 1000 MHz
- Frequency steps: 60 kHzIF-Bandwidth: 120 kHz
- Measuring time / Frequency step: 100 µs (BT Timing 1.25 ms)

Test report Reference: MDE\_PARRO\_1003\_FCCa

- Turntable angle range: -180 to 180°

- Turntable step size: 90°

- Height variation range:  $1-3\ m$  - Height variation step size:  $2\ m$ 

- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

#### Step 2: second measurement

For the relevant emissions determined in step 1, an additional measurement with the following settings will be performed. Intention of this step is, to find out the approximate turntable angle and antenna height for each frequency.

- Detector: Peak - Maxhold

- Measured frequencies: in step 1 determined frequencies

IF – Bandwidth: 120 kHzMeasuring time: 100 ms

- Turntable angle range: -180 to 180°

- Turntable step size: 45°

Height variation range: 1 – 4 m
Height variation step size: 0.5 m
Polarisation: horizontal + vertical

After this step the EMI test system has determined the following values for each frequency (of step 1):

- Frequency

- Azimuth value (of turntable)

- Antenna height

The last two values have now the following accuracy:

- Azimuth value (of turntable): 45°

- Antenna height: 0.5 m

#### Step 3: final measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will be slowly varied by +/- 22.5° around this value. During this action the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position the antenna height is also slowly varied by +/- 25 cm around the antenna height determined. During this action the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

- Detector: Peak - Maxhold

- Measured frequencies: in step 1 determined frequencies

IF – Bandwidth: 120 kHzMeasuring time: 100 ms

- Turntable angle range: -22.5° to + 22.5° around the determined value

- Height variation range: -0.25 m to + 0.2 5m around the determined value

Step 4: final measurement with QP detector

With the settings determined in step 3, the final measurement will be performed: EMI receiver settings for step 4:

- Detector: Quasi-Peak (< 1 GHz)

- Measured frequencies: in step 1 determined frequencies

IF – Bandwidth: 120 kHzMeasuring time: 1 s

#### 3. Measurement above 1 GHz

The following modifications apply to the measurement procedure for the frequency range above 1 GHz:

The measurement distance was reduced to 1 m. The results were extrapolated by the extrapolation factor of 20 dB/decade (inverse linear-distance for field strength measurements, inverse linear-distance squared for the power reference level measurements). Due to the fact that in this frequency range a double ridged wave guided horn antenna (up to 18 GHz) and a horn antenna (18-25 GHz) are used, the steps 2-4 are omitted. Step 1 was performed with one height of the receiving antenna only. EMI receiver settings:

- Detector: Peak, Average
- RBW = VBW = 100 kHz

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

For the enhanced data rate packets the test is performed as worst-case-check in order to verify that emissions have a comparable level as found at basic data rate. Typically, the measurement for these packets is performed in the frequency range 1 to 8 GHz but it depends on the emissions found during the test for the basic data rate. Please refer to the results for the used frequency range.

#### 3.4.2 Test Requirements / Limits

FCC Part 15, Subpart C, §15.247 (d)

... In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

FCC Part 15, Subpart C, §15.209, Radiated Emission Limits

| Frequency in MHz | Limit (µV/m) | Measurement distance (m) | Limit(dBµV/m @10m)  |
|------------------|--------------|--------------------------|---------------------|
| 0.009 - 0.49     | 2400/F(kHz)  | 300                      | Limit (dBµV/m)+30dB |
| 0.49 - 1.705     | 24000/F(kHz) | 30                       | Limit (dBµV/m)+10dB |
| 1.705 - 30       | 30           | 30                       | Limit (dBµV/m)+10dB |

| Frequency in MHz | Limit (µV/m) | Measurement distance (m) | Limit (dBµV/m) |
|------------------|--------------|--------------------------|----------------|
| 30 - 88          | 100          | 3                        | 40.0           |
| 88 - 216         | 150          | 3                        | 43.5           |
| 216 - 960        | 200          | 3                        | 46.0           |
| above 960        | 500          | 3                        | 54.0           |

#### §15.35(b)

..., there is also a limit on the radio frequency emissions, as measured using instrumentation with a peak detector function, corresponding to 20 dB above the maximum permitted average limit....

Used conversion factor: Limit (dB $\mu$ V/m) = 20 log (Limit ( $\mu$ V/m)/1 $\mu$ V/m)

#### 3.4.3 Test Protocol

Temperature: 25 °C Air Pressure: 1014 hPa Humidity: 32 %

#### 3.4.3.1 Measurement up to 30 MHz

| Op. Mode  | Setup     | Port      |
|-----------|-----------|-----------|
| op-mode 1 | Setup_a02 | Enclosure |

| Polari-<br>sation | Frequency<br>MHz | Corrected value<br>dBµV/m |      |    | Limit<br>dBµV/<br>m | Limit<br>dBµV/<br>m | Limit<br>dBµV/<br>m | Delta to<br>limit<br>dB | Delta to<br>limit<br>dB |
|-------------------|------------------|---------------------------|------|----|---------------------|---------------------|---------------------|-------------------------|-------------------------|
|                   |                  | QP                        | Peak | AV | QP                  | Peak                | AV                  | QP/Peak                 | AV                      |
| O°                | -                | -                         | -    | -  | -                   | -                   | -                   | -                       | -                       |
| 90°               | -                | -                         | -    | -  | _                   | -                   | -                   | -                       | -                       |

Remark: No (further) spurious emissions in the range 20 dB below the limit found therefore step 2 was not performed.

#### 3.4.3.2 Measurement above 30 MHz

#### 3.5 Band edge compliance

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: ANSI C 63.4, 2003 FCC §15.31

#### 3.5.1 Test Description

The procedure to show compliance with the band edge requirement is divided into two measurements: 1. Show compliance of the lower band edge by a conducted measurement and 2. show compliance of the higher band edge by a radiated and conducted measurement.

For the first measurement the EUT is set to transmit on the lowest channel (2402 MHz). The lower band edge is 2400 MHz.

Analyzer settings:
- Detector: Peak

- RBW= 100 kHz

- VBW= 300 kHz

For the second measurement the EUT is set to transmit on the highest channel (2480 MHz). The higher band edge is 2483.5 MHz.

Analyzer settings for conducted measurement:

Detector: PeakRBW= 100 kHzVBW= 300 kHz

Analyzer settings for radiated measurement:

Detector: Peak, AverageRBW = VBW = 100 kHz

#### 3.5.2 Test Requirements / Limits

FCC Part 15.247 (d)

"In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

. . .

Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c))."

For the measurement of the **lower band edge** the RF power at the band edge shall be "at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power..."

For the measurement of the **higher band edge** the limit is "specified in Section 15.209(a)".

| op-mode 12 | passed |

#### 3.6 Dwell time

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.31

#### 3.6.1 Test Description

The Equipment Under Test (EUT) was set up to perform the dwell time measurements. The EUT was connected to the spectrum analyzer via a short coax cable. The dwell time is calculated by:

Dwell time = time slot length \* hop rate / number of hopping channels \* 31.6 s

#### with:

- hop rate = 1600 \* 1/s for DH1 packets =  $1600 s^{-1}$
- hop rate = 1600/3 \* 1/s for DH3 packets =  $533.33 s^{-1}$
- hop rate = 1600/5 \* 1/s for DH5 packets =  $320 s^{-1}$
- number of hopping channels = 79
- 31.6 s = 0.4 seconds multiplied by the number of hopping channels = 0.4 s \* 79

The highest value of the dwell time is reported.

#### 3.6.2 Test Requirements / Limits

FCC Part 15, Subpart C, §15.247 (a) (1) (iii)

Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Since the Bluetooth technology uses 79 channels this period is calculated to be 31.6 seconds.

#### 3.6.3 Test Protocol

#### 3.7 Channel separation

Standard FCC Part 15, 10-1-09 Edition Subpart C

The test was performed according to: FCC §15.31

#### 3.7.1 Test Description

The Equipment Under Test (EUT) was set up to perform the channel separation measurements. The channel separation is independent from the modulation pattern. The EUT was connected to spectrum analyzer via a short coax cable. Analyzer settings:

- Detector: Peak-Maxhold

- Span: 3 MHz

- Centre Frequency: a mid frequency of the 2.4 GHz ISM band

Resolution Bandwidth (RBW): 30 kHzVideo Bandwidth (VBW): 100 kHz

- Sweep Time: Coupled

#### 3.7.2 Test Requirements / Limits

FCC Part 15, Subpart C, §15.247 (a) (1)

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

# 5 Photo Report

Photo 1: Test setup for radiated measurements (Enclosure, below 30 MHz)

Photo 2: Test setup for radiated measurements (Enclosure, 30 MHz to 1 GHz)

Photo 3: Test setup for radiated measurements (Enclosure, above 1 GHz)

Photo 4: EUT (front side)

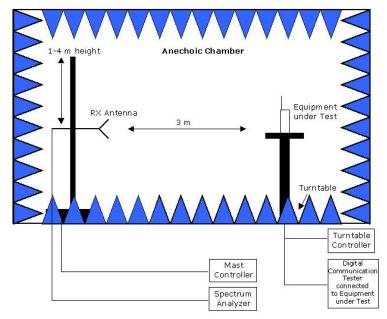

Photo 5: EUT (rear side)

# 6 Setup Drawings

<u>Remark:</u> Depending on the frequency range suitable antenna types, attenuators or preamplifiers are used.

## **Drawing 1:** Setup in the Anechoic chamber:

Measurements below 1 GHz: Semi-anechoic, conducting ground plane. Measurements above 1 GHz: Fully-anechoic, absorbers on all surfaces

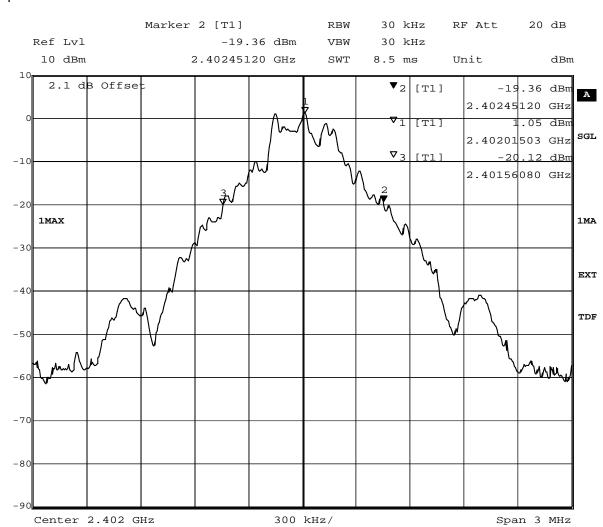

## 7 Annex measurement plots

## 7.1 Occupied bandwidth

## 7.1.1 Occupied bandwidth operating mode 1

#### Op. Mode

Title: 20dB Bandwidth

Comment A: CH B: 2402 MHz; 20dB bandwidth (kHz):890.4

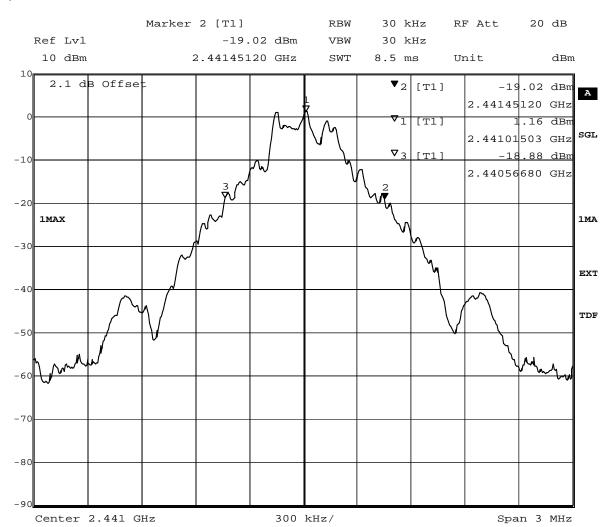

Date: 15.APR.2010 13:37:21

## 7.1.2 Occupied bandwidth operating mode 2

#### Op. Mode

op-mode 2

Title: 20dB Bandwidth

Comment A: CH M: 2441 MHz; 20dB bandwidth (kHz):884.4

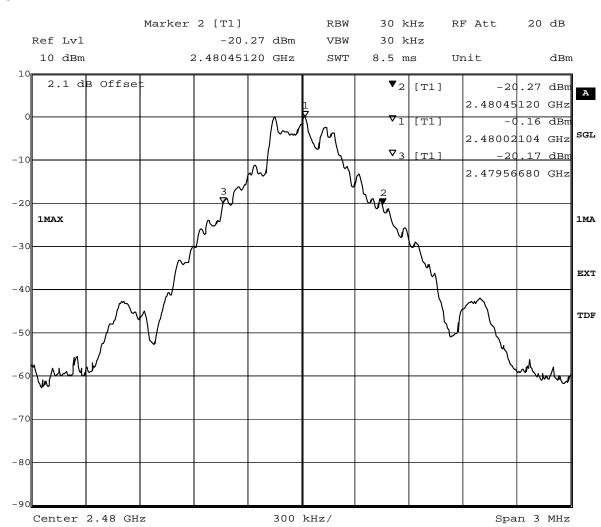

Date: 15.APR.2010 13:58:17

## 7.1.3 Occupied bandwidth operating mode 3

#### Op. Mode

op-mode 3

Title: 20dB Bandwidth

Comment A: CH T: 2480 MHz; 20dB bandwidth (kHz):884.4

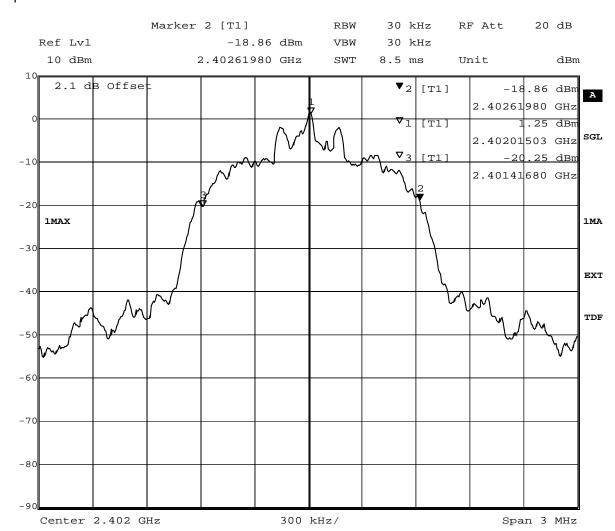

Date: 15.APR.2010 14:17:02

## 7.1.4 Occupied bandwidth operating mode 6

#### Op. Mode

op-mode 6

Title: 20dB Bandwidth

Comment A: CH B: 2402 MHz; 20dB bandwidth (kHz):1203

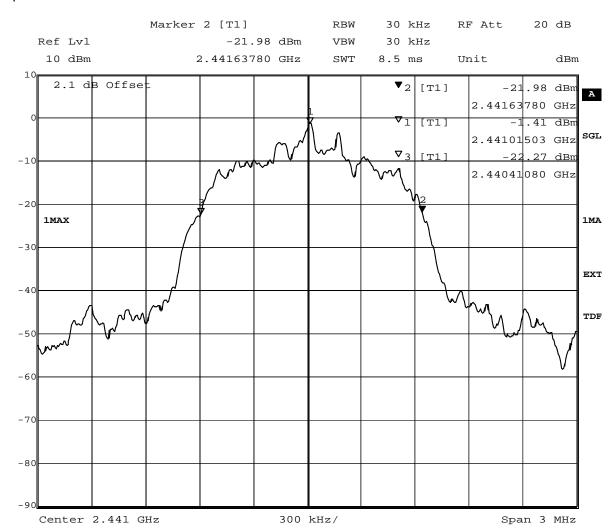

Date: 16.APR.2010 06:42:09

## 7.1.5 Occupied bandwidth operating mode 7

#### Op. Mode

op-mode 7

Title: 20dB Bandwidth

Comment A: CH M: 2441 MHz; 20dB bandwidth (kHz):1227

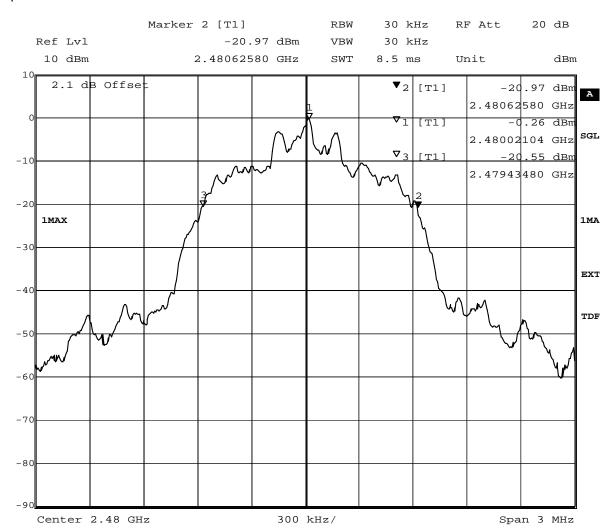

Date: 16.APR.2010 06:58:36

## 7.1.6 Occupied bandwidth operating mode 8

#### Op. Mode

op-mode 8

Title: 20dB Bandwidth

Comment A: CH T: 2480 MHz; 20dB bandwidth (kHz):1191

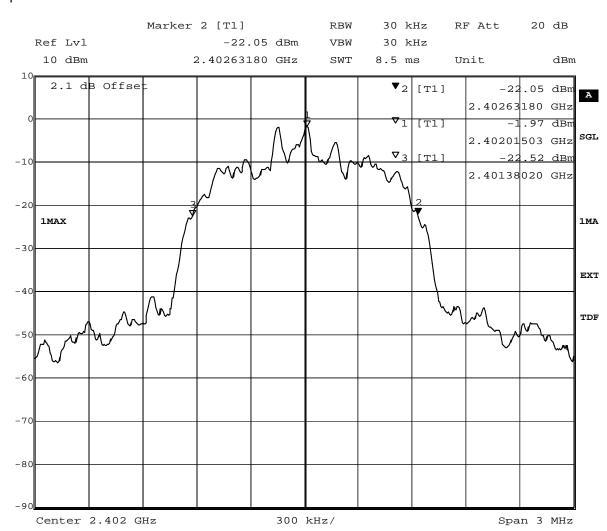

Date: 16.APR.2010 08:07:22

## 7.1.7 Occupied bandwidth operating mode 10

#### Op. Mode

op-mode 10

Title: 20dB Bandwidth

Comment A: CH B: 2402 MHz; 20dB bandwidth (kHz):1251.6

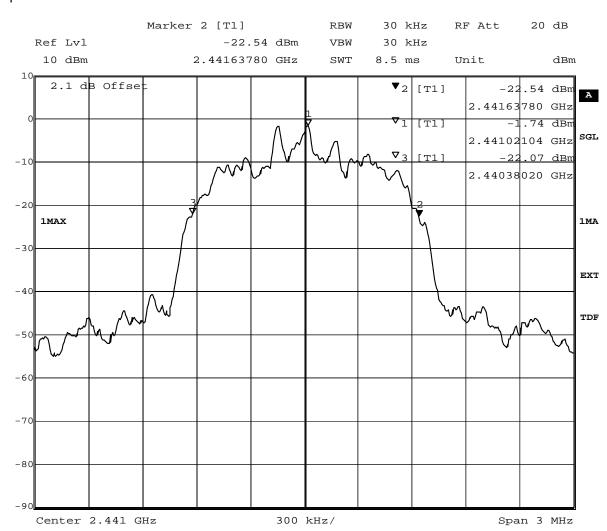

Date: 15.APR.2010 14:50:42

## 7.1.8 Occupied bandwidth operating mode 11

#### Op. Mode

op-mode 11

Title: 20dB Bandwidth

Comment A: CH M: 2441 MHz; 20dB bandwidth (kHz):1257.6

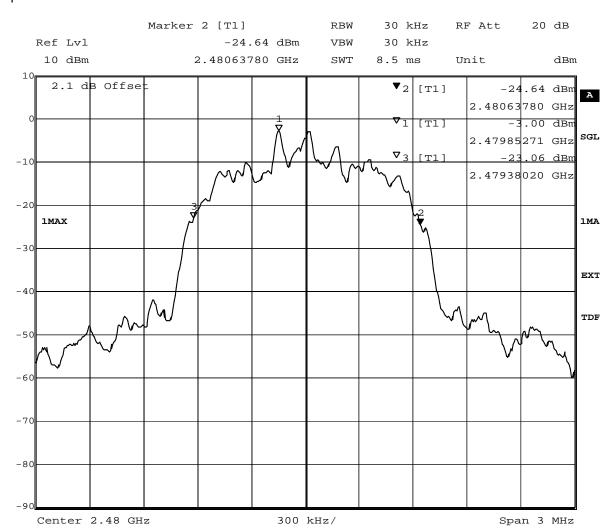

Date: 15.APR.2010 15:08:19

## 7.1.9 Occupied bandwidth operating mode 12

#### Op. Mode

op-mode 12

Title: 20dB Bandwidth

Comment A: CH T: 2480 MHz; 20dB bandwidth (kHz):1257.6

Date: 15.APR.2010 15:25:41

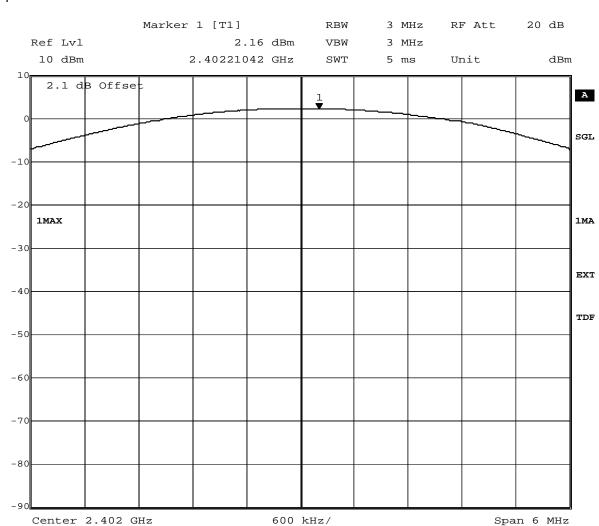

## 7.2 Peak power output

## 7.2.1 Peak power output operating mode 1

#### Op. Mode

op-mode 1
