EUT Description of Operation

The basic function of the RGL Smartbar EUT transmitter is to provide a wireless user interface to the RGL 600 Smartbar. The RGL 600 Smartbar is typically mounted outside on the edge of the hood of a vehicle. The user must interface with this system to make configuration changes and to simply operate the device.

Using a combination of button strokes, this can easily be achieved with a 3-button interface box. The wireless version (EUT Transmitter) eliminates the need to require long, cumbersome cables used in previous models. It operates at 419 Mhz and is powered by a small battery typically found in watches.
