Manufacturer:	Mertik Maxitrol GmbH & Co. KG
Address:	Warnstedter Strasse 3 06502 Thale, Germany
Type:	Remote control
Model:	e -FLAME
Serial-No.:	G6R

Operating description

The remote control G6R operates a gas control and ignition device which is used in space heaters or decorative gas fires.

Pushing 2 buttons at the hand set sends a signal to the receiver which starts the following ignition sequence.

- A motorized valve closes the main gas
- A capacitor powers a dc magnet which opens the thermo electric safety valve.
- At the same time starts the electronic ignition and the pilot gas will be ignited. The pilot flame heats the thermocouple.
- Until the thermo element gives enough voltage to hold the safety magnet open (about 10...20 sec), the electronic of the receiver delivers the voltage.
- The motorized valve opens the main gas

After this ignition the remote control can be used to adjust the flame height by turning the motor of the main gas valve. The signal to turn the motor will be sent manually pushing the up and down button or automatically for versions with a thermostat inbuilt in the hand set. For manual flame height adjustment it takes about 10sec to change from off to maximum flame height. The thermostat compares every 5 minutes and sends signals to start or stop the turning of the motor.

Pressing the off button a signal turns the motor to the off position and interrupts the thermo voltage.
