

Response to TCB Findings

1. For this class II permissive change filing, radiated spurious emissions test data must be provided upto the 10th harmonic of the transmitter or upto 40GHz. Please clarify.

Test data above 2GHz provided as attached.

2. Pg 8 of the report mentions removal of caps. If the original schematics has changed, the updated version is required. Please clarify.

The schematics will not change. The BoM changes to indicate if the cap location is populated or not. The previously applied version will continue to have the caps whereas this version will not. However, they share the same schematic.
