1.0 INTRODUCTION

1.1 Scope

This report is designed to show compliance with the following standards:

- FCC Part 15, Subpart B rules for an unintentional radiator
- ETSI EN 301 489-1
- VCCI V-3 / 2000.04

The test procedures described in American National Standards Institute C63.4: 1992, VCCI V-3 / 2000.04, and CISPR 16-1: 1993 were employed. A description of the product and operating configurations, the various provisions of the rules, the methods for determining compliance and a detailed summary of the results are included within this test report.

1.2 Executive Summary

Colubris Networks

Equipment Under Test: Access Point, Model: Soling

Test Description	Class	Comments
Radiated Emissions		
• FCC Part 15	B	Pass
• ETSI EN 301 489-1	B	Pass
• VCCI	B	Pass
Harmonics & Flicker		
• ETSI EN 301 489-1	-	Pass
Conducted Emissions (AC Mains)		
• FCC Part 15	B	Pass
• ETSI EN 301 489-1	B	Pass
• VCCI	B	Pass

See section 1.9 for modifications required for compliance.

1.3 Job description

1.3.1 Client Information

The EUT has been tested at the request of

Company: Colubris Networks
420 Armand-Frappier Suite 200
QC, H7V 4B4 Canada

Name of contact: Mr. Claude Robitaille

Telephone: 450-680-1661

Fax: 450-680-1910

1.3.2 Equipment under test (EUT)

Equipment type: Access Point

Model number(s): Soling

Part or serial number: M021-00017

Manufacturer: Colubris Networks

EUT receive date: December 8, 2003

EUT received condition: Good

EUT type: Wireless LAN

Test start date: December 15, 2003

Test end date: February 16, 2004

1.3.3 Test plan reference

The test procedures described in American National Standards Institute C63.4: 1992, VCCI V-3 / 2000.04, and CISPR 16-1: 1993 were employed.

1.4 Brief Description of EUT and Received Condition

The Access Point, Model: Soling, is a wireless LAN router conforming to the IEEE 802.11a/b/g standards. The normal temperature range of operation is from 0 to 50 degrees celsius. The Soling unit contains two 802.11a/b/g radios, designated Wvlan0 and Wvlan1 during testing. The EUT is capable of being powered via an AC power supply or through power over ethernet via a power injector.

A Production version of the sample was received on December 8, 2003 in good condition.

1.6 System Block Diagram

The diagram shown below details the interconnections of the equipment under test to the support equipment.

1.7 EUT Operation and Exercise

The EUT was activated from nominal power and set to transmit normally.

1.8 Justifications

The system was configured for testing in a typical fashion (as a customer would normally use it), and in the confines as outlined in C63.4 (2000).

The arrangement of the cables dangling from the rear of the table was varied to the extent possible to produce the maximum emissions.

For maximizing emissions, the system was rotated through 360°, the antenna height was varied from 1 meter to 4 meters above the ground plane, and the antenna polarization was changed. This step by step procedure for maximizing emissions led to the data reported.

1.9 Modifications Required for Compliance

No modifications were installed during compliance testing in order to bring the product into compliance (Please note that this list does not include changes made specifically by Colubris Networks prior to compliance testing).

2.0 TEST ENVIRONMENT

2.1 Test Facility

Site 2C (Middle Site) is a 3m and 10m sheltered EMI measurement range located in a light commercial environment in Boxborough, Massachusetts. It meets the technical requirements of ANSI C63.4-1992 and CISPR 22:1993/EN 55022:1994 for radiated and conducted emission measurements. The shelter structure is entirely fiberglass and plastic, with outside dimensions of 33 ft x 57 ft. The structure resembles a quonset hut with a center ceiling height of 16.5 ft.

The testing floor is covered by a galvanized sheet metal groundplane that is earth-grounded via copper rods around the perimeter of the site. The joints between individual metal sheets are bridged with 2 inch wide metal strips to provide low RF impedance contact throughout. The sheets of metal are screwed in place with stainless steel, round-head screws every three inches. Site illumination and HVAC are provided from beneath the ground reference plane through flush entry ports, the port covers are electrically bonded to the ground plane.

A flush metal turntable with 12 ft. diameter and 5000 lb. load capacity is provided for floor-standing equipment. A wooden table 80 cm high is used for table-top equipment. The turntable is electrically connected to the ground plane with three copper straps. The straps are connected to the turntable at the center of it with ground braid. A copper strap is directly connected to the groundplane at the edges of the turntable. The turntable is located on the south end of the structure and the antennas are mounted 3 and 10 meters away to the north. The antenna mast is a non-conductive with remote control of antenna height and polarization. The antenna height is adjustable from 1 to 4 meters.

All final radiated emission measurements are performed with the testing personnel and measurement equipment located below the ground reference plane. The site has a full basement underneath the turntable where support equipment may be remotely located. Operation of the antenna, turntable and equipment under test is controlled by remote controls that manipulate the antenna height and polarization with a turntable control. Test personnel are located below the ellipse when measurements are performed, however the site maintains the ability of having personnel manipulate cables while monitoring test equipment. Ambient radiated emissions are 6 dB or more below the relevant FCC emission limits.

AC mains power is brought to the equipment under test through a power line filter, to remove ambient conducted noise. 50 Hz (240 VAC single phase), 60 Hz power (120 VAC single phase, 208 VAC three phase), and 60 Hz (480 VAC three phase) are available. Conducted emission measurements are performed with a Line Impedance Stabilization Network (LISN) or Artificial Mains Network (AMN) bonded to the ground reference plane. A removable vertical groundplane (2 meter X 2 meter area) is used for line-conducted measurements for table top equipment. The vertical groundplane is electrically connected to the reference groundplane.

+ - Note that these items were used prior to the calibration due date

* - AC Power Voltage was verified using a digital multimeter, listed in the test equipment section.

2.3 Field Strength Calculation

The following is how net radiated field strength readings were determined:

$$NF = RF + AF + CF - PF - AVF - DF$$

Where,

NF = Net Reading in dB μ V/m

RF = Reading from receiver in dB μ V

AF = Antenna Correction Factor in dB(1/m)

CF = Cable Correction Factor in dB

PF = Pre-Amplifier Correction Factor in dB

AVF = Duty Cycle Correction Factor in dB (only if applicable)

DF = Distance Factor in dB (using 20 dB/decade unless otherwise specified)

To convert from dB μ V/m to μ V/m or mV/m the following was used:

$$UF = 10^{(NF / 20)}$$

Where,

UF = Net Reading in μ V/m

Example:

$$NF = RF + AF + CF - PF - AVF - DF = 62.9 + 13.7 + 2.1 - 16.1 - 0.0 - 10.5 = 52.1 \text{ dB}\mu\text{V/m}$$

$$UF = 10^{(52.1 \text{ dB}\mu\text{V} / 20)} = 403 \mu\text{V/m}$$

2.4 Measurement Uncertainty

The expanded uncertainty ($k = 2$) for radiated emissions from 30 to 1000 MHz has been determined to be:
 ± 4 dB at 10m, ± 5.4 dB at 3m

The expanded uncertainty ($k = 2$) for mains conducted emissions from 150 kHz to 30 MHz has been determined to be:

± 2.6 dB

3.0 ELECTROMAGNETIC RADIATION DISTURBANCE

3.1 Test Limits

Radiated Disturbance Limit for FCC, ETSI EN 301 489-1, and VCCI

Radiated Emission Limits at 10 meters		
Frequency (MHz)	Class A Quasi-Peak limits, dB ($\mu\text{V}/\text{m}$)	Class B Quasi-Peak limits, dB ($\mu\text{V}/\text{m}$) ⁽¹⁾
30 to 230	40	30
230 to 1000	47	37

⁽¹⁾ Note: If the field strength measurement at 10m cannot be made because of high ambient noise levels or for other reasons, measurement of Class B EUT's may be made at a closer distance, for example 3m. An inverse proportionality factor of 20 dB per decade should be used to normalize the measured data to the specific distance for determining compliance. For example, a factor of -10.5 dB should be applied to a reading taken at 3 meters

3.2 Test Procedure

Measurements are conducted with a quasi-peak detector instrument in the frequency range of 30 MHz to 1000 MHz. The measuring receiver meets the requirements of Section One of CISPR 16 and the measuring antenna correlates to a balanced dipole.

Measurements of the radiated field are made with the antenna located at a distance of 10 meters from the EUT. If the field-strength measurements at 10m cannot be made because of high ambient noise level or for other reasons, measurements of Class B equipment may be made at a closer distance, for example 3m. An inverse proportionality factor of 20 dB per decade should be used to normalize the measured data to the specified distance for determining compliance.

The antenna is adjusted between 1m and 4m in height above the ground plane for maximum meter reading at each test frequency.

The antenna-to-EUT azimuth is varied during the measurement to find the maximum field-strength readings.

The antenna-to-EUT polarization (horizontal and vertical) is varied during the measurements to find the maximum field-strength readings.

Equipment setup for radiated disturbance tests followed the guidelines of ANSI C63.4: 1992, ETSI EN 301 489-1, VCCI V-3 / 2000.04.

3.3 Test Results

The test results are located in Table 3.3-1.

3.4 Test Configuration Photograph

Figures 3.4-1 and 3.4-2 show the testing configurations used.

4.0 AC MAINS LINE-CONDUCTED DISTURBANCE

4.1 Test Limits

FCC, ETSI EN 301 489-1, and VCCI Limits for Mains Ports Conducted Disturbances

Frequency band MHz	Class A Limit (dB μ V)		Class B Limit (dB μ V)	
	Quasi-Peak	Average	Quasi-Peak	Average
0.15-0.50	79	66	66 to 56*	56 to 46*
0.50-5.00	73	60	56	46
5.00-30.00	73	60	60	50

* The limit decreases linearly with the logarithm of the frequency in the range of 0.15 MHz to 0.50 MHz.

Note: The lower limit shall apply at the transition frequency

4.2 Test Procedure

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification. Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for table-top use, is placed 0.4m from a vertical metal reference plane of at least 2m by 2m and shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT.

Floor standing EUTs are placed on a horizontal metal ground plane, the point(s) of contact being consistent with normal use but not in metallic contact with the ground plane. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

Equipment setup for conducted disturbance tests followed the guidelines of ANSI C63.4: 1992, ETSI EN 301 489-1, VCCI V-3 / 2000.04.

4.3 Test Results

The test results are located in Tables 4.3-1 through 4.3-12.

4.4 Test Configuration Photographs

Figures 4.4-1 through 4.4-8 show the testing configurations used.

5.0 LABELING AND INSTRUCTION MANUAL REQUIREMENTS

5.1 FCC Part 15, Subpart B

5.1.1 Labeling Requirements

Devices must be labeled with the following statement:

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

5.1.2 Instruction Manual Requirements

The users manual or instruction manual for an unintentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

CLASS A

For a Class A digital device or peripheral, the instructions furnished to the user shall include the following or similar statement, placed in a prominent location in the text of the manual:

NOTE: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

If shielded cables or other specialized accessories are necessary for the unit to achieve compliance, a statement similar to the following should be added:

Shielded cables must be used with this unit to ensure compliance with the Class A FCC limits.

CLASS B

For a Class B digital device or peripheral, the instructions furnished to the user shall include the following or similar statement, placed in a prominent location in the text of the manual:

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- **Reorient or relocate the receiving antenna.**
- **Increase the separation between the equipment and receiver.**
- **Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.**
- **Consult the dealer or an experienced radio TV technician for help.**

If shielded cables or other specialized accessories are necessary for the unit to achieve compliance, a statement similar to the following should be added:

Shielded cables must be used with this unit to ensure compliance with the Class B FCC limits.

5.2 ETSI EN 301 489-1

5.2.1 Labeling Requirements

There are no specific labeling requirements for ETSI EN 301 489-1.

5.2.2 Instruction Manual Requirements

Class A equipment should not be restricted in sale but the following warning shall be in the instructions for use:

Warning

This is a class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

5.3 VCCI

5.3.1 Labeling Requirements

The VCCI specifies that the following labels must be placed on equipment meeting Class A and Class B VCCI limits.

CLASS A

この装置は、クラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。 VCCI-A

CLASS B

5.3.2 Instruction Manual Requirements

The VCCI requires that statements be placed in the user's manual for devices meeting VCCI Class A and Class B limits.

CLASS A

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

CLASS B

この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスB情報技術装置です。この装置は、家庭環境で使用することを目的としていますが、この装置がラジオやテレビジョン受信機に近接して使用されると、受信障害を引き起こすことがあります。
取扱説明書に従って正しい取り扱いをして下さい。
