Overall Assessment Letter for Ezze VI-1
FCC id: RV2VI1

I have reviewed this composite application and find it compliant. This is an application for a mobile phone supporting GSM/GPRS and Bluetooth. The handset supports 850 MHz and 1900 MHz frequency range in both GSM and GPRS modes. Since the mobile phone also has a USB port for connection to Computers a filing for a Class B Computer peripheral has also been made. The phone additionally supports DCS 1800, however is not relevant as it is not supported in North America.

Please note the following:

The Bluetooth conducted output power is less than 24mW and the distance between the Bluetooth and GSM antennas is greater than 5cm and therefore, simultaneous transmission SAR assessment was deemed as not being required. The highest reported Head SAR was 0.116 W/kg and the highest reported Body SAR was 0.118 W/kg with 15mm separation maintained. Assessment was carried out with a headset connected to the device.

As a result of the assessment review a block diagram was provided which included the Bluetooth module. Additionally the 15B and SAR reports were revised to correct a calibration due date and inclusion of the graphical field pattern for SAR.

I underwent the FCC RF exposure training with the FCC in October 2008.

Yours sincerely
