# 1. Report Revision History

| Revision | Date        | Description   |
|----------|-------------|---|
| -        | 27 APR 2023 | Initial Release of Engineering Test Report No. 2203581-02 |

# 2. Introduction

#### 2.1. Scope of Tests

This document presents the results of a series of RF emissions tests that were performed on the Etymotic Research Inc TALA Bluetooth Hearing Aids (hereinafter referred to as the Equipment Under Test (EUT)). The EUT was manufactured and submitted for testing by Etymotic Research Inc located in Elk Grove Village, IL.

#### 2.2. Purpose

The test series was performed to determine if the EUT meets the RF emission requirements of the FCC "Code of Federal Regulations" Title 47, Part 15, Subpart C, §15.247 for a Digital Modulation intentional radiator operating within the 2400 – 2483.5MHz band.

The test series was also performed to determine if the EUT meets the RF emission requirements of the Innovation, Science, and Economic Development Canada Radio Standards Specification RSS-Gen and RSS-247 for a Digital Modulation intentional radiator operating within the 2400 – 2483.5MHz band.

Testing was performed in accordance with ANSI C63.10-2013.

#### 2.3. Identification of the EUT

The EUT was identified as follows and used throughout the test series:

| EUT Identification           |   |  |  |
|------------------------------|---|--|--|
| Product Description          | TALA Bluetooth Hearing Aids             |  |  |
| Model/Part No.               | Tala                                    |  |  |
| Serial No.                   | (LEFT) 003A (RIGHT) 008B                |  |  |
| Software/Firmware Version    | Ezairo 10.4.8 (Audio Processor)         |  |  |
|                              | RSL10 11.0.8 (Bluetooth Radio)          |  |  |
| Device Type                  | Digitally Modulated Transmission Device |  |  |
| Band of Operation            | 2400 – 2483.5MHz                        |  |  |
| Modulation Type              | BLE                                     |  |  |
| Antenna Type                 | Trace                                   |  |  |
| Rated Output Power           | 0.000038W (-14.13dBm)                   |  |  |
| 6dB Bandwidth                | 784.2kHz                                |  |  |
| Occupied Bandwidth (99% CBW) | 1.164MHz                                |  |  |
| FCC ID & ISED UPN Number     | FCC ID: RWT-BAVOTW                      |  |  |
|                              | ISED UPN: 25701-BAVOTW                  |  |  |

### 3. Power Input

The EUT was powered by an internal battery

### 4. Grounding

The EUT was not connected to ground.

# 5. Support Equipment

The EUT was submitted for testing along with the following support equipment:

| Item                                | Description                 |
|-------------------------------------|-----------------------------|
| Laptop                              | Used to control transmitter |
| Euler Engineering Tool Version 0.00 | Connects EUT to laptop      |

### 6. Interconnect Leads

No interconnect cables were submitted with the test item.

### 7. Modifications Made to the EUT

No modifications were made to the EUT during the testing.

# 8. Mode of Operation

The EUT was energized and programmed to transmit in the following mode:

| Mode | Description |
|------|-------------|
|      | - 2402MHz   |
| BLE  | - 2440MHz   |
|      | - 2480MHz   |

# 9. Test Specifications

The tests were performed to selected portions of, and in accordance with, the test specifications.

- Federal Communications Commission "Code of Federal Regulations", Title 47, Chapter I, Subchapter A, Part 15, Subpart B "Unintentional Radiators"
- Federal Communications Commission "Code of Federal Regulations", Title 47, Chapter I, Subchapter A, Part 15, Subpart C "Intentional Radiators"
- ANSI C63.4-2014 "American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40GHz"
- ANSI C63.10-2013 "American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices"
- KDB 558074 D01 v05r02, April 2, 2019 "Guidance For Compliance Measurements On Digital Transmission System, Frequency Hopping Spread Spectrum System, and Hybrid System Devices Operating Under Section 15.247 of the FCC Rules"
- RSS-Gen Issue 5, February 2021, Amendment 2, Innovation, Science, and Economic Development Canada "General Requirements for Compliance of Radio Apparatus"
- RSS-247 Issue 2, February 2017 "Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and License-Exempt Local Area Network (LE-LAN) Devices"

#### 10. Test Plan

No test plan was provided. Instructions were provided by personnel from Etymotic Research Inc and used in conjunction with the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.247, Innovation, Science, and Economic Development Canada, RSS-247, and ANSI C63.10-2013 specifications.

#### 11. Deviation, Additions to, or Exclusions from Test Specifications

There were no deviations, additions to, or exclusions from the test specifications during this test series.

#### 12. Laboratory Conditions

The ambient parameters of the laboratory during testing were as follows:

| Ambient Parameters   | Value    |
|----------------------|----------|
| Temperature          | 23.4°C   |
| Relative Humidity    | 23%      |
| Atmospheric Pressure | 1021.0mb |

## 13. Summary

The following EMC tests were performed, and the results are shown below:

| Test Description                          | Requirements               | Test Method      | Results  |
|---|----------------------------|------------------|----------|
| 6dB Bandwidth                             | FCC 15.247<br>ISED RSS-247 | ANSI C63.10:2013 | Conforms |
| Occupied Bandwidth (99%)                  | FCC 15.247<br>ISED RSS-247 | ANSI C63.10:2013 | Conforms |
| Effective Isotropic Radiated Power (EIRP) | FCC 15.247<br>ISED RSS-247 | ANSI C63.10:2013 | Conforms |
| Spurious Radiated Emissions               | FCC 15.247<br>ISED RSS-247 | ANSI C63.10:2013 | Conforms |
| Band-Edge Compliance                      | FCC 15.247<br>ISED RSS-247 | ANSI C63.10:2013 | Conforms |
| Power Spectral Density                    | FCC 15.247<br>ISED RSS-247 | ANSI C63.10:2013 | Conforms |

# 14. Sample Calculations

For Radiated Emissions:

The resultant field strength (FS) is a summation in decibels (dB) of the receiver meter reading (MTR), the antenna correction factor (AF), and the cable loss factor (CF). If an external preamplifier is used, the total is reduced by its gain (-PA). If a distance correction (DC) is required, it is added to the total.

Formula 1: FS  $(dB\mu V/m) = MTR (dB\mu V) + AF (dB/m) + CF (dB) + (-PA (dB)) + DC (dB)$ 

To convert the Field Strength dB $\mu$ V/m term to  $\mu$ V/m, the dB $\mu$ V/m is first divided by 20. The Base 10 AntiLog is taken of this quotient. The result is the Field Strength value in  $\mu$ V/m terms.

Formula 2: FS ( $\mu$ V/m) = AntiLog [(FS (dB $\mu$ V/m))/20]

# 15. Statement of Conformity

The Etymotic Research Inc TALA Bluetooth Hearing Aids (Model No. Tala, Serial No. (LEFT) 003A (RIGHT) 008B) did fully conform to the selected requirements of FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.247 and Innovation, Science, and Economic Development Canada, RSS-247.

# 16. Certification

Elite Electronic Engineering Incorporated certifies that the information contained in this report was obtained under conditions which meet or exceed those specified in the FCC "Code of Federal Regulations" Title 47 Part 15, Subpart C, Section 15.247 and Innovation, Science, and Economic Development Canada, RSS-247 test specifications. The data presented in this test report pertains to the EUT on the test date specified. Any electrical or mechanical modifications made to the EUT subsequent to the specified test date will serve to invalidate the data and void this certification.

|---|-------------|
|   | Expanded    |
| Measurement Type  | Measurement |
|   | Uncertainty |
| Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 6 GHz) | 3.1         |

| Requirements   |  |
|--|--|
| Systems using digital modulation techniques shall have a minimum 6dB bandwidth of 500kHz |  |

Procedure

The EUT was set up inside the chamber. The EUT was allowed to transmit continuously.

The transmit channel was set separately to low, middle, and high channels. The resolution bandwidth (RBW) was set to 100kHz, the video bandwidth (VBW) was set to the same as or 3 times greater than the RBW, and the span was set to 3 times the RBW.

The 'Max-Hold' function was engaged. The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined. The analyzer's display was then screenshot and saved.

Procedure

The EUT was set up inside the chamber.

The EUT was allowed to transmit continuously. The transmit channel was set separately to low, middle, and high channels. The resolution bandwidth (RBW) was set to 1% to 5% of the actual occupied / x dB bandwidth, the video bandwidth (VBW) was set 3 times greater than the RBW, and the span was set large enough to capture all products of the modulation process, including the emission skirts, around the carrier frequency.

The 'Max-Hold' function was engaged. The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined. The analyzer's display was plotted using a 'screen dump' utility.

#### Requirements

The output power shall not exceed 4W (36dBm).

#### Procedure

The EUT was placed on the non-conductive stand and set to transmit. A double ridged waveguide antenna was placed at a test distance of 3 meters from the EUT. The resolution bandwidth (RBW) of the spectrum analyzer was set to greater than the 6dB bandwidth. The EUT was maximized for worst case emissions (or maximum output power) at the measuring antenna. The maximum meter reading was recorded. The peak power output was measured for the low, middle, and high channels.

The equivalent power was determined from the field intensity levels measured at 3 meters using the substitution method. To determine the emission power, a double ridged waveguide antenna was then set in place of the EUT and connected to a calibrated signal generator. The output of the signal generator was adjusted to match the received level at the spectrum analyzer. The signal level was recorded. The reading was then corrected to compensate for cable loss and antenna gain, as required. The peak power output was calculated for low, middle, and high hopping frequencies.

| Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 6 GHz)     | 3.1                                    |
| Radiated disturbance (electric field strength on an open area test site or alternative test site) (6 GHz – 18 GHz)    | 3.2                                    |
| Radiated disturbance (electric field strength on an open area test site or alternative test site) (18 GHz – 26.5 GHz) | 3.3                                    |

#### Procedure

Radiated measurements were performed in a 32ft. x 20ft. x 14ft. high shielded enclosure. The shielded enclosure prevents emissions from other sources, such as radio and TV stations, from interfering with the measurements. All powerlines and signal lines entering the enclosure pass through filters on the enclosure wall. The powerline filters prevent extraneous signals from entering the enclosure on these leads.

Preliminary radiated emissions tests were performed to determine the emission characteristics of the EUT. For the preliminary test, a broadband measuring antenna was positioned at a 3-meter distance from the EUT. The entire frequency range from 30MHz to 25GHz was investigated using a peak detector function.

The final open field emission tests were then manually performed over the frequency range of 30MHz to 25GHz.

- 1) For all harmonics not in the restricted bands, the following procedure was used:
  - a) The field strength of the fundamental was measured using a double ridged waveguide antenna. The waveguide antenna was positioned at a 3-meter distance from the EUT. The EUT was placed on a 1.5-meter-high non-conductive stand. A peak detector with a resolution bandwidth of 100 kHz was used on the spectrum analyzer.
  - b) The field strengths of all of the harmonics not in the restricted band were then measured using a double-ridged waveguide antenna. The waveguide antenna was positioned at a 3-meter distance from the EUT. The EUT was placed on a 1.5-meter-high non-conductive stand. A peak detector with a resolution bandwidth of 100kHz was used on the spectrum analyzer.
  - c) To ensure that maximum or worst-case emission levels at the fundamental and harmonics were measured, the following steps were taken when measuring the fundamental emissions and the spurious emissions:
    - i) The EUT was rotated so that all of its sides were exposed to the receiving antenna.
    - ii) Since the measuring antenna is linearly polarized, both horizontal and vertical field components were measured.
    - iii) The measuring antenna was raised and lowered for each antenna polarization to maximize the readings.
    - iv) In instances where it was necessary to use a shortened cable between the measuring antenna and the spectrum analyzer, the measuring antenna was not raised or lowered to ensure maximized readings. Instead, the EUT was rotated through all axis to ensure the maximum readings were recorded for the EUT.
  - d) All harmonics not in the restricted bands must be at least 20dB below levels measured at the fundamental. However, attenuation below the general limits specified in §15.209(a) is not required.
- 2) For all emissions in the restricted bands, the following procedure was used:
  - a) The field strengths of all emissions below 1GHz were measured using a bi-log antenna. The bi-log antenna was positioned at a 3-meter distance from the EUT. The EUT was placed on an 80cm high non-conductive stand. A peak detector with a resolution bandwidth of 100kHz was used on the spectrum analyzer.
  - b) The field strengths of all emissions above 1GHz were measured using a double-ridged waveguide antenna. The waveguide antenna was positioned at a 3-meter distance from the EUT. The EUT was placed on a 1.5-meter-high non-conductive stand. A peak detector with a resolution bandwidth of 1MHz was used on the spectrum analyzer.
  - c) To ensure that maximum or worst-case emission levels were measured, the following steps were taken when taking all measurements:
    - i) The EUT was rotated so that all of its sides were exposed to the receiving antenna.
    - ii) Since the measuring antenna is linearly polarized, both horizontal and vertical field components

were measured.

- iii) The measuring antenna was raised and lowered for each antenna polarization to maximize the readings.
- iv) In instances where it was necessary to use a shortened cable between the measuring antenna and the spectrum analyzer, the measuring antenna was not raised or lowered to ensure maximized readings. Instead, the EUT was rotated through all axis to ensure the maximum readings were recorded for the EUT.
- d) For all radiated emissions measurements below 1GHz, if the peak reading is below the limits listed in §15.209(a), no further measurements are required. If, however, the peak readings exceed the limits listed in §15.209(a), then the emissions are remeasured using a quasi-peak detector.
- e) For all radiated emissions measurements above 1GHz, the peak readings must comply with the §15.35(b) limits. §15.35(b) states that when average radiated emissions measurements are specified, there also is a limit on the peak level of the radiated emissions. The limit on the peak radio frequency emissions is 20dB above the maximum permitted average emission limit applicable to the equipment under test. Therefore, all peak readings above 1GHz must be no greater than 20dB above the limits specified in §15.209(a).
- f) Next, for all radiated emissions measurements above 1GHz, the resolution bandwidth was set to 1MHz. The analyzer was set to linear mode with a 10Hz video bandwidth in order to simulate an average detector. An average reading was taken.

| site) (1 GHz – 6 GHz)   | 0.1         |  |  |  |  |

#### Procedure

#### 1) Low Band Edge:

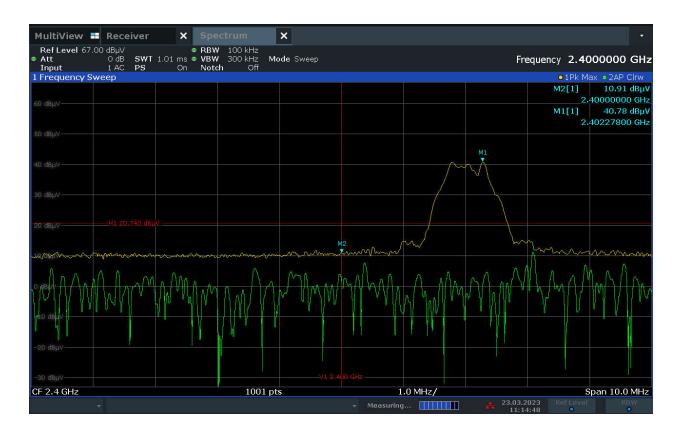

- a) The EUT was set up inside the test chamber on a non-conductive stand and a broadband measuring antenna was placed at a test distance of 3 meters from the EUT.
- b) The EUT was set to transmit continuously at the channel closest to the low band-edge.
- c) The EUT was maximized for worst case emissions at the measuring antenna and the maximum meter reading was recorded.
- d) To determine the band edge compliance, the following spectrum analyzer settings were used:
  - Center Frequency = 2400MHz (low band-edge frequency).
  - Span = Wide enough to capture the peak level of the emission operating on the channel closest to the band-edge, as well as any modulation products which fall outside of the authorized band of operation.
  - Resolution Bandwidth (RBW) =  $\geq$  1% of the span.
  - 'Max-Hold' function was engaged.
- e) The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined.
- f) The marker was set on the peak of the in-band emissions. A display line was placed 20dB down from the peak of the in-band emissions. All emissions which fall outside of the authorized band of operation must be below the 20dB down display line. (All emissions to the left of the center frequency (band-edge) must be below the display line.)
- g) The analyzer's display was then screenshot and saved.
- 2) High Band Edge:

- a) The EUT was set up inside the test chamber on a non-conductive stand and set to transmit continuously at the channel closest to the high band-edge.
- b) A broadband measuring antenna was placed at a test distance of 3 meters from the EUT. The antenna was connected to the input of a spectrum analyzer.
- c) The center frequency of the analyzer was set to the high band edge (2483.5MHz).
- d) The Resolution Bandwidth was set to 1MHz.
- e) To ensure that the maximum or worst-case emission level was measured, the following steps were taken:
  - o The EUT was rotated so that all of its sides were exposed to the receiving antenna.
  - Since the measuring antenna is linearly polarized, both horizontal and vertical field components were measured.
  - The EUT was rotated so that all of its sides were exposed to the receiving antenna.
  - The measuring antenna was raised and lowered from 1 to 4 meters for each antenna polarization to maximize the readings.
  - The highest measured peak reading and the highest measured average reading were recorded.

#### Requirement

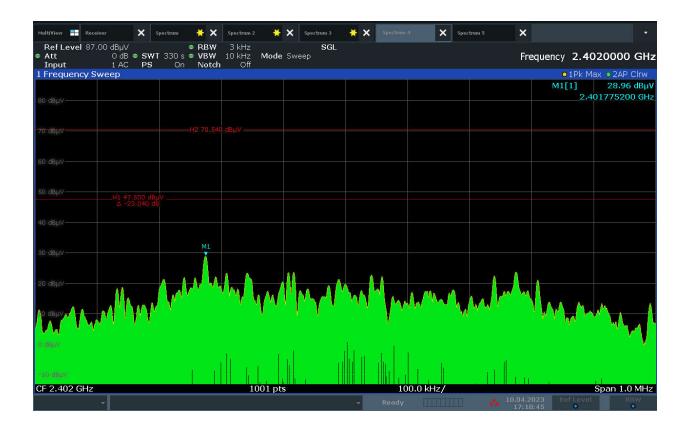

The power spectral density from the intentional radiator to the antenna shall not be greater than 8dBm in any 3kHz band during any time interval of continuous transmission.

#### Procedure

- 1) The EUT was set up inside the test chamber on a non-conductive stand and set to transmit at the mid channel. A broadband measuring antenna was placed near the EUT.
- 2) To determine the power spectral density, the following spectrum analyzer settings were used:
  - Center Frequency = Transmit Frequency
  - Span = 1.5 × the DTS (6dB) bandwidth
  - Resolution Bandwidth (RBW) = > DTS (6dB) bandwidth
  - Sweep time = Auto
  - Detector = Peak
  - Trace Function = Max-Hold
- 3) The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined. A display line was then placed on the corresponding +8dBm level.
- 4) The EUT was then placed in the transmit mode. To determine the power spectral density, the following spectrum analyzer settings were used:
  - Center Frequency = Transmit Frequency
  - Span = 1.5× the DTS (6dB) bandwidth
  - Resolution Bandwidth (RBW) = 3kHz ≤ RBW ≤ 100kHz
  - Sweep time = Auto
  - Detector = Peak
  - Trace Function = Max-Hold
- 5) The display line was then placed on the corresponding +8dBm level.
- 6) The receiver display was then screenshot and saved.

### 26. Scope of Accreditation

#### SCOPE OF ACCREDITATION TO ISO/IEC 17025:2017

ELITE ELECTRONIC ENGINEERING, INC. 1516 Centre Circle Downers Grove, IL 60515 Robert Bugielski (QA Manager) Phone: 630 495 9770 ext. 168 Email: rbugielski@elitetest.com Craig Fanning (EMC Lab Manager) Phone: 630 495 9770 ext. 112 Email: cfanning@elitetest.com Brandon Lugo (Automotive Team Leader) Phone: 630 495 9770 ext. 163 Email: blugo@elitetest.com Richard King (FCC/Commercial Team Leader) Phone: 630 495 9770 ext. 123 <u>Email: reking@elitetest.com</u> Website: www.elitetest.com

Valid To: June 30, 2023

ELECTRICAL

Certificate Number: 1786.01

In recognition of the successful completion of the A2LA Accreditation Program evaluation process, accreditation is granted to this laboratory to perform the following <u>automotive electromagnetic</u> <u>compatibility and other electrical tests</u>:

| <u>Test Technology:</u>       | <u>Test Method(s)<sup>1</sup>:</u>   |
|-------------------------------|--|
| Transient Immunity            | ISO 7637-2 (including emissions); ISO 7637-3;<br>ISO 16750-2:2012, Sections 4.6.3 and 4.6.4; |
|                               | CS-11979, Section 6.4; CS.00054, Section 5.9;  |
|                               | EMC-CS-2009.1 (CI220); FMC1278 (CI220, CI221, CI222);  |
|                               | GMW 3097, Section 3.5; SAE J1113-11; SAE J1113-12;   |
|                               | ECE Regulation 10.06 Annex 10  |
| Electrostatic Discharge (ESD) | ISO 10605 (2001, 2008);  |
| 3, ,                          | CS-11979 Section 7.0; CS.00054, Section 5.10;  |
|                               | EMC-CS-2009.1 (CI 280); FMC1278 (CI280); SAE J1113-13;                                       |
|                               | GMW 3097 Section 3.6   |
| Conducted Emissions           | CISPR 25 (2002, 2008), Sections 6.2 and 6.3;   |
|                               | CISPR 25 (2016), Sections 6.3 and 6.4;   |
|                               | CS-11979, Section 5.1; CS.00054, Sections 5.6.1 and 5.6.2;                                   |
|                               | GMW 3097, Section 3.3.2;   |
|                               | EMC-CS-2009.1 (CE 420); FMC1278 (CE420, CE421)   |
| Radiated Emissions Anechoic   | CISPR 25 (2002, 2008), Section 6.4;  |
|                               | CISPR 25 (2016), Section 6.5;  |
|                               | CS-11979, Section 5.3; CS.00054, Section 5.6.3;  |
|                               | GMW 3097, Section 3.3.1;   |
|                               | EMC-CS-2009.1 (RE 310); FMC1278 (RE310);   |
|                               | ECE Regulation 10.06 Annex 7 (Broadband)   |
|                               | ECE Regulation 10.06 Annex 8 (Narrowband)  |
|                               | Λ  |

(A2LA Cert. No. 1786.01) Revised 06/24/2021

# **Accredited Laboratory**

A2LA has accredited

# ELITE ELECTRONIC ENGINEERING INC.

Downers Grove, IL

for technical competence in the field of

# **Electrical Testing**

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 General requirements for the competence of festing and calibration laboratories. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communiqué dated April 2017).

Presented this 19th day of May 2021.

Vice President, Accreditation Services For the Accreditation Council Certificate Number 1786.01 Valid to June 30, 2023

For the tests to which this accreditation applies, please refer to the laboratory's Electrical Scope of Accreditation.
